## Foreword.

This foreword is addressed to those who have read the first version of this paper issued as Technical Report 26. We decided to publish a second version for the following reason. Our main interest is the space $\mathrm{P}^{\alpha}(\mathrm{D})$, the restriction of the space $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ (cf. Part. I) to an open subset D of $\mathrm{R}^{n}$. Since we do not have any general intrinsic definition of the space $\mathrm{P}^{\alpha}(\mathrm{D})$, in Report 26 we introduced the space $\mathrm{P}^{\alpha}(\mathrm{D})$ which is defined in an intrinsic and direct manner and which in general satisfies $\mathrm{P}^{\alpha}(\mathrm{D}) \supset \mathrm{P}^{\alpha}(\mathrm{D})$. Our main concern was to define a class of open sets D, as large as possible, for which ${ }^{\check{x}}(\mathrm{D})=\mathrm{P}^{\alpha}(\mathrm{D})$. After the first version appeared we noticed that we could define a functional space (denoted here temporarily by $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ ) by a definition as simple as that of $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and which better approximates the class $\mathrm{P}^{\alpha}(\mathrm{D})$, more precisely, $\check{P}^{\alpha}(D) \supset \check{P}^{\check{\alpha}}(D) \supset \mathrm{P}^{\alpha}(D)$. Furthermore, we noticed that all the theorems we obtained for $\check{\mathrm{P}}{ }^{\alpha}(\mathrm{D})$ have their analogues for the class $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$. In most cases these analogues are simpler to state, admit simpler proofs, and often are more general. We decided, therefore, to abandon the preceding definition of $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and, starting with the present paper, we deal only with the class $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ which will be denoted from now on by $\left.{ }_{\mathrm{P}}{ }^{\alpha}(\mathrm{D}){ }^{1}\right)$.

Another change in the second version is due to the fact that we were able to apply the idea of Lichtenstein reflection of order $p$ (in particular the reflection of order $\infty$ introduced by R. T. Seeley [11] in the case of hyperplanes) to the Lipschitzian graph domains. By such generalized Lichtenstein exten-

[^0]r. adams, n. aronszajn and k. t. Smith
sion we obtain an unrestricted, simultaneous extension theorem for SLG-domains. In the previous version we used the Calderon extension method which gives only simultaneous extensions between two consecutive integers.

Other improvements and additions are described in the Introduction.

## Introduction.

This second part of the «Theory of Bessel Potentials» contains only Chapter III, which deals with open subsets of a euclidean space. Chapter IV, which will appear subsequently will deal with potentials on manifolds.

The most natural way of defining potentials in a subdomain D of $\mathrm{R}^{n}$ is to define them as restrictions of potentials in the whole space. This class is denoted by $\mathrm{P}^{\alpha}(\mathrm{D})$. However, this is not an intrinsic definition and it would be very inconvenient in applications. We therefore introduce the class ${ }_{\mathrm{P}}{ }^{\alpha}(\mathrm{D})$ formed by functions in $\mathrm{P}_{100}^{\alpha}(\mathrm{D})$ and having a finite standard norm $|u|_{\alpha, \mathrm{D}}$. In the past this standard norm has been used for integral orders $\alpha$. We now extend it to non-integral $\alpha$ by formula (2.1) of § 2 . We also introduce the approximate $\alpha$-norm, $\mid u 1_{\alpha, \mathrm{D}}$, by formula (2.3) of $\S 2$ which is equivalent to the standard $\alpha$-norm but is simpler to use.

The main purpose of this paper is to investigate the class ${ }^{\mathrm{P}}{ }^{\alpha}(\mathrm{D})$ and its relations to $\mathrm{P}^{\alpha}(\mathrm{D})$. Since the functions in $\mathrm{P}^{\alpha}(\mathrm{D})$ are restrictions of those in $\mathrm{P}^{a}$, the properties of $\mathrm{P}^{\alpha}(\mathrm{D})$ are already very well determined. It is of importance therefore to investigate those domains where $\check{\mathrm{P}}^{\alpha}(\mathrm{D})=\mathrm{P}^{\alpha}(\mathrm{D})$. For all «regular » domains D this equality holds. It is one of the main purposes of the paper to find as general classes of domains as possible for which this equality still holds. The equality can be characterized by the fact that for the class $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ there exists a linear continuous extension-mapping into the class $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ assigning to each $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ an extension $\tilde{u}$, $\tilde{u} \in \mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$, defined in the whole space.

In addition to the main problem of extension we investigate many other properties of functions in ${ }_{\mathrm{P}}{ }^{\alpha}(\mathrm{D})$.

We give now a brief summary of the sections of this paper.
$\S 0$ takes up an idea proposed in the last remark of Chap. II, (going back to Lebesgue), i.e. to «correct» any
given locally integrable function in a well determined way (e.g. by taking limits of the mean values) so that if the function is equivalent to a "nice» function, the corrected function will also be nice. We use this idea in many instances by assuming, a priori, that we are dealing with "corrected" functions and this makes for simpler statements and proofs.
§ 1 introduces the class $\mathrm{P}^{\alpha}(\mathrm{D})$ and gives translations (for the most part obvious) of the properties of $\mathrm{P}^{\alpha}$ into those of $\mathrm{P}^{\alpha}(\mathrm{D})$.
§ 2. The class ${ }_{\mathrm{P}}{ }^{\alpha}(\mathrm{D})$ is defined. Among other things, we take up the problem of multipliers and show that if $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and if $\varphi$ and all of its derivatives up to order $\alpha^{*}\left(\alpha^{*}\right.$ is the greatest integer $<\alpha$ ) are Lipschitzian on D , then $u \rightarrow q u$ is a bounded mapping of $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ into $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$.
§ 3 deals with the problem of inessential singularities of functions in $\check{\mathrm{P}}{ }^{\alpha}(\mathrm{D})$ and shows under what circumstances it is possible to extend $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ to a function in $\check{\mathrm{P}}^{\alpha}\left(\mathrm{D}_{1}\right)$ when $D_{1}$ differs from $D$ by a set of Lebesgue measure 0 . This result is applied to develop the Lichtenstein extension method for hyperplanes.

In § 4 the behavior of the standard and approximate norms for a single function $u$ when $\alpha$ varies is considered. In particular the properties of the standard and approximate norms are studied as $\alpha$ converges to an integer. It is shown that $|u|_{\alpha, \mathrm{D}}$ is a continuous function of $\alpha$ when D is convex.
§ 5 introduces the idea of boundary properties and their localization. This is applied to convex domains to define the L-convex domains which have, essentially, the local structure of $\mathrm{C}^{(0,1)}$-homeomorphic images of convex domains. This is the largest class in which we can prove essentially all the properties of functions in $\mathrm{P}^{\alpha}(\mathrm{D})$ for the functions in ${ }^{{ }^{\alpha}}{ }^{\alpha}(\mathrm{D})$ (it is not known if for L-convex $\mathrm{D}, \mathrm{P}^{\alpha}(\mathrm{D})=\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ for all $\alpha$ ).

In § 6 we define the graph domains and show that $\mathrm{P}^{\alpha}(\mathrm{D})$ is dense in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ for this class of domains.
$\S 7$ introduces the class of domains $\&(I)$ where I is an interval in $[0, \infty) . \mathrm{D} \in \mathscr{E}(\mathrm{I})$ if there is a linear extension mapping of the smallest linear class of functions containing $\bigcup_{\alpha \in \mathrm{I}} \check{\mathrm{P}}^{\alpha}(\mathrm{D})$
into the measurable functions on $\mathrm{R}^{n}$ such that the mapping carries ${ }_{\mathrm{P}}{ }^{\alpha}(\mathrm{D})$ boundedly (uniformly on every compact subinterval of I) into $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ for $\alpha \in \mathrm{I}$. A localization theorem is proved for the class $\mathscr{E}(\mathrm{I})$; in imprecise terms it can be stated as follows: if $D$ is locally in $\mathcal{E}(I)$ then $D \in \mathscr{E}(I)$.
$\S 8$ and § 9 are preparatory sections for the main theorems of the paper which are proved in $\S 10$ and $\S 11$. In $\S 8$ the regularized distance and singular multipliers are defined and a number of their properties are proved.
§ 9 gives the necessary theoretical background for the constructions in $\S 10$. It is the most involved section of the present paper, made more complicated by the necessity of obtaining uniform bounds in different theorems in order to have uniform bounds in the simultaneous extension theorems of § 10 .
§ 10. We introduce the notions of uniform and regular systems $\left\{\mathrm{Q}_{i}\right\}$ where $\mathrm{Q}_{i}=\overline{\mathrm{D}}_{i}$ and the $\mathrm{D}_{i}$ are open sets satisfying certain properties. The main results of this section are concerned with the case where all the $\mathrm{D}_{i}^{\prime} \mathrm{s}$ are in $\mathcal{E}(\mathrm{I})$ and we determine additional conditions under which $\left(\bigcup_{i} \mathrm{Q}_{i}\right)^{0}$ - the interior of $\bigcup_{i} \mathrm{Q}_{i}$ - also belongs to $\mathscr{E}(\mathrm{I})$.

In § 11 we define the generalized Lichtenstein extension. We use this extension to prove that if $\partial \mathrm{D}$ is locally Lipschitzian then $\mathrm{D} \in E([0, \infty))$ i.e. there is a simultaneous linear extension of $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ into $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ for all $\alpha \geqq 0$.

In § 12 we apply the results of $\S 10$ and $\S 11$ to establish the extension theorem for some concrete classes of domains. First we find a necessary and sufficient condition for a convex domain D (bounded or unbounded) to be in $\varepsilon([0, \infty))$. The condition is that for some bounded cone C and for every $x \in \partial \mathrm{D}$ there is a congruent cone with vertex $x$ contained in $\overline{\mathrm{D}}$. Secondly we prove that all finite geometric polyhedra which are not locally disconnected by their boundary belong to $\mathcal{E}([0, \infty))$.
§ 13 gives different examples and counter examples concerning the subjects treated in the paper.

In recent years a great amount of work was done concerning Bessel potentials connected with $\mathrm{L}^{p}$ classes in $\mathrm{R}^{n}[2,3,4$,
$7,10,12,13]$. Of the different classes considered only the classes $\mathrm{P}^{\alpha, p}\left({ }^{2}\right)$ lend themselves to a treatment in open subsets of $\mathrm{R}^{n}$ analogous to the one given in the present paper for the class $\mathrm{P}^{\alpha}\left(\check{\mathrm{P}}^{\alpha}(\mathrm{D})\right.$ is identified in this connection with $\left.\check{\mathrm{P}}^{\alpha, 2}(\mathrm{D})\right)$. It turns out that with very few exceptions, for all statements concerning ${ }^{\mathrm{P}}{ }^{\alpha}(\mathrm{D})$ there exist parallel statements concerning ${ }_{\mathrm{P}}{ }^{\alpha, p}(\mathrm{D})$. At the end of most of the sections of this paper remarks are made to show in what manner the results of the section can be extended to the class ${ }_{\mathrm{P}}{ }^{\alpha, p}(\mathrm{D})$. Since almost all the exceptions occur in the cases $p=1$ and $p=\infty$, we restrict these statements essentially to the case $1<p<\infty$.

Finally, we have added an Appendix where we treat the question of complete continuity for the standard norms of different orders. The problem for non-integral orders differs in many aspects from the one for integral orders which has already been investigated by many authors.

The bibliography contains only references which were not given in Part. I.

For the convenience of the reader a list of symbols, notations and terminology introduced in this paper is given after the bibliography.
${ }^{(2)}$ See [2]. These classes are perfect completions which correspond to the classes $\mathrm{W}_{\boldsymbol{p}}^{a}[2,3,7,10,12,13]$; these latter classes appear as completions relative to the class of sets of Lebesgue measure 0 .

## CHAPTER III

## THE SPACES $\mathbf{P}^{\alpha}(\mathrm{D})$ AND r $^{\alpha}(\mathrm{D})$.

## 0 . The corrected functions.

In the last remark of Part I (Chap. II, § 11) we introduced the corrected function $u^{\prime}$ for any function $u$ locally integrable in an open set $\mathrm{D} \subset \mathrm{R}^{n}\left(u \in \mathrm{~L}_{\text {loc }}^{1}(\mathrm{D})\right)$ by defining

$$
\begin{equation*}
u^{\prime}(x)=\lim _{\rho \ngtr 0} \frac{1}{|\mathrm{~S}(x, \rho)|} \int_{\mathrm{s}(x, \rho)} u(y) d y, \tag{0.1}
\end{equation*}
$$

for all $x \in \mathrm{D}$ for which the limit exists and is finite. All the other points of D form the exceptional set of $u^{\prime}$ : the corrected function is not defined there.

The idea of such a "correction" goes back to Lebesgue; $u^{\prime}(x)=u(x)$ a.e. and the exceptional set is of measure 0 . Since in some instances the use of corrected functions allows a simplification of statements and proofs we will review the main properties of corrected functions in this section.

If we introduce the function $\varphi^{0}(x)=\frac{n}{\omega_{n}} \chi^{0}(x)$, where $\chi^{0}$ is the characteristic function of the unit sphere $\mathrm{S}(0,1)$ and $\omega_{n}$ is the area of $\partial \mathrm{S}(0,1)$, formula ( 0.1 ) can be written

$$
u^{\prime}(x)=\lim _{\rho \nless 0} \int u(x-y) \rho^{-n} \varphi^{0}(y / \rho) d y .
$$

This formula suggests a more general procedure to define corrected functions. We consider any bounded measurable
function $\varphi(x)$ vanishing outside of a compact such that

$$
\begin{equation*}
\int \varphi(x) d x=1 \tag{0.2}
\end{equation*}
$$

We put then

$$
\begin{equation*}
u^{\varphi}(x)=\lim _{\rho>0} \int u(x-y) \rho^{-n} \varphi(y / \rho) d y \tag{0.3}
\end{equation*}
$$

for all $x \in \mathrm{D}$ for which the limit exists and is finite. The other points of D form the exceptional set of $u^{\varphi}$.

Obviously $u^{\varphi}$ is the same for all $u$ in the same equivalence class (relative to Lebesgue measure). The following proposition is also obvious.

1) If $u_{k} \in \mathrm{~L}_{\mathrm{loc}}^{1}(\mathrm{D}), k=1,2, \alpha_{k}$ are complex numbers,

$$
u=\alpha_{1} u_{1}+\alpha_{2} u_{2}
$$

and if $\mathrm{A}^{\varphi}$ and $\mathrm{A}_{k}^{\varphi}$ denote the exceptional sets of $u^{\varphi}$ and $u_{k}^{\varphi}$ respectively, then $\mathrm{A}^{\varphi} \subset \mathrm{A}_{1}^{\varphi} \cup \mathrm{A}_{2}^{\circ}$ and

$$
u^{\varphi}(x)=\alpha_{1} u_{1}^{\varphi}(x)+\alpha_{2} u_{2}^{\varphi}(x) \quad \text { for } \quad x \in \mathrm{D}-\left(\mathrm{A}_{1}^{\varphi} \cup \mathrm{A}_{2}^{\varphi}\right) .
$$

For $u \in \mathrm{~L}_{\text {loc }}^{1}(\mathrm{D})$ the Lebesgue set of $u$ is the set of all $x \in \mathrm{D}$ for which there exists a number $u^{\mathrm{L}}(x)$ such that
(0.4) $\lim _{p \ngtr 0} \frac{1}{|\mathrm{~S}(x, \rho)|} \int_{\mathrm{s}(x, \rho)}\left|u(y)-u^{\mathrm{L}}(x)\right| d y$

$$
\equiv \lim _{\rho \ngtr 0} \int\left|u(x-y)-u^{\mathrm{L}}(x)\right| \rho^{-n} \varphi^{0}(y / \rho) d y=0 .
$$

A classical theorem of Lebesgue says that the exceptional set of $u^{\mathrm{L}}$ (i.e. D - the Lebesgue set) is of measure 0 and that

$$
u^{\mathrm{L}}(x)=u(x)
$$

a.e. in D.

As a counterpart of Prop. 1) we get immediately
$1^{\prime}$ ) If $u_{k} \in \mathrm{~L}_{100}^{1}(\mathrm{D}), k=1,2, u=\alpha_{1} u_{2}+\alpha_{2} u_{2}$ and $\mathrm{A}^{\mathrm{L}}$ and $\mathrm{A}_{k}^{\mathrm{L}}$ are the exceptional sets of $u^{\mathrm{L}}$ and $u_{k}^{\mathrm{L}}$ respectively then

$$
\mathrm{A}^{\mathrm{L}} \subset \mathrm{~A}_{1}^{\mathrm{L}} \cup \mathrm{~A}_{2}^{\mathrm{L}}
$$

and

$$
u^{\mathrm{L}}(x)=\alpha_{1} u_{1}^{\mathrm{L}}(x)+\alpha_{2} u_{2}^{\mathrm{L}}(x) \quad \text { for } \quad x \in \mathrm{D}-\left(\mathrm{A}_{1}^{\mathrm{L}} \cup \mathrm{~A}_{2}^{\mathrm{L}}\right) .
$$

2) If $u \in \mathrm{~L}_{\mathrm{loc}}^{1}(\mathrm{D})$, then for any $\varphi, u^{\varphi}$ is an extension of $u^{\mathrm{L}}$.

In fact, if $x$ is in the Lebesgue set of $u, \mathrm{M}$ is the bound of $\varphi$ and $\varphi(y)=0$ for $|y|>\delta$, then

$$
\begin{aligned}
&\left|\int u(x-y) \rho^{-n} \varphi(y / \rho) d y-u^{\mathrm{L}}(x)\right| \\
&=\left|\int\left[u(x-y)-u^{\mathrm{L}}(x)\right] \rho^{-n} \varphi(y / \rho) d y\right| \\
& \leqslant \int\left|u(x-y)-u^{\mathrm{L}}(x)\right| \rho^{-n}|\varphi(y / \rho)| d y \\
& \leqslant \frac{\omega_{n}}{n} \mathbf{M} \delta^{n} \int\left|u(x-y)-u^{\mathrm{L}}(x)\right|(\rho \delta)^{-n} \varphi^{0}(y / \rho \delta) d y
\end{aligned}
$$

and by (0.4) the last integral converges to 0 for $\rho \backslash 0$.
It follows from Prop. 2) that $u, u^{\mathrm{L}}$, and all the $u^{\varphi}$ are in the same equivalence class. We may call $u^{L}$ the minimal corrected function. The introduction of the function $u^{\varphi}$ besides $u^{L}$ is justified by the fact that in many cases it is easier to find the set where $u^{\varphi}$ is defined rather then the Lebesgue set. A case in point is the following application to Fourier transforms of $L^{2}$ functions.
3) Let $u \in \mathrm{~L}^{2}\left(\mathrm{R}^{n}\right)$. The corrected function $u^{\varphi}$ is given pointspise by

$$
\begin{equation*}
u^{\varphi}(x)=\lim _{\rho>0} \int e^{i(x, \xi)} \hat{u}(\xi) \hat{\varphi}(\rho \xi) d \xi \tag{0.5}
\end{equation*}
$$

and the exceptional set of $u^{\varphi}$ is the set of $x$ 's where the limit does not exist (or is infinite).

The proof is immediate since

$$
(2 \pi)^{n / 2} \hat{u}(\xi) \hat{\varphi}(\rho \xi)=\left(u(x) * \rho^{-n} \varphi(x / \rho)\right)^{\lambda}
$$

and $\hat{\varphi}(\xi)$ is an entire function of order $1, L^{2}$ on $R^{n}$, so that $\hat{u}(\xi) \hat{\varphi}(\rho \xi) \in \mathrm{L}^{1}$ and the integral in (0.5) is an ordinary Lebesgue integral.

For different functions $u$ we may choose different functions $\varphi$ to simplify the integration in (0.5). We give here the transform of the simplest functions $\varphi$.
a) Spherical means, $\varphi=\varphi^{0}, \hat{\varphi}(\xi)=\frac{n}{\omega_{n}}|\xi|^{-n / 2} J_{n / 2}(|\xi|)$ where $J_{n / 2}(|\xi|)$ is the Bessel function of first kind of order $n / 2$;
b) Cubic means, $\varphi=$ characteristic function of the cube $\left|x_{k}\right|<1 / 2, k=1, \ldots, n, \hat{\varphi}(\xi)=\prod_{k=1}^{n} \sqrt{\frac{2}{\pi}} \frac{\sin \frac{1}{2} \xi_{k}}{\xi_{k}}$.

We add two more general propositions:
4) Let $u \in \mathrm{~L}_{\text {loc }}^{1}(\mathrm{D})$ and $\varphi \in \mathrm{L}_{\text {boc }}^{\infty}(\mathrm{D})$. The function (up) ${ }^{\mathrm{L}}$ is an extension of $u^{L} \varphi^{L}\left({ }^{(3)}\right)$.
In fact, let $x$ be in the intersection of the Lebesgue sets of $u$ and $\varphi$. Then

$$
\begin{aligned}
\left.\frac{1}{|\mathrm{~S}(x, \rho)|} \int_{\mathrm{s}(x, \rho)} \right\rvert\, u(y) \varphi(y) & -u^{\mathrm{L}}(x) \varphi^{\mathrm{L}}(x) \mid d y \\
& \leqslant \frac{1}{|\mathrm{~S}(x, \rho)|}\left[\int_{\mathrm{s}(x, \rho)}\left|u(y)-u^{\mathrm{L}}(x)\right||\varphi(y)| d y\right. \\
& \left.+\int_{\mathrm{S}(x, \rho)}\left|u^{\mathrm{L}}(x)\right|\left|\varphi(y)-\nu^{\mathrm{L}}(x)\right| d y\right]
\end{aligned}
$$

and the right side $\rightarrow 0$ for $\rho \downarrow 0$ by virtue of (0.4) since

$$
\varphi \in \mathrm{L}_{\mathrm{loc}}^{\infty}(\mathrm{D}) .
$$

5) Let T be a homeomorphism of D onto $\mathrm{D}^{*}$ such that T and $\mathrm{T}^{-1}$ are locally Lipschitzian. Then if $u \in \mathrm{~L}_{\mathrm{loc}}^{1}(\mathrm{D})$ and

$$
u^{*}\left(x^{*}\right)=u\left(\mathbf{T}^{-1} x^{*}\right),
$$

the Lebesgue set of $u$ is mapped onto the Lebesgue set of $u^{*}$ and $u^{* \mathrm{~L}}\left(x^{*}\right)=u^{\mathrm{L}}\left(\mathrm{T}^{-1} x^{*}\right)$.

Proof. - For $x \in \mathrm{D}$ there are constant M and $\rho_{0}$ such that for $|y-x|<\mathrm{M}^{-1} \rho_{0}, \mathrm{M}^{-1}|y-x| \leqslant|\mathrm{T} y-\mathrm{T} x| \leqslant \mathrm{M}|y-x|$ and the Jacobian $\frac{\partial(y)}{\partial(T y)}$ is majorated a.e. by $\mathrm{M}^{n}$. Hence for $\rho \leqslant \rho_{0}$ and any number $u_{0}$ we have

$$
\begin{aligned}
\frac{\mathrm{M}^{-2 n}}{\left|\mathrm{~S}\left(x, \mathrm{M}^{-1} \rho\right)\right|} \int_{\mid x-y_{i}<\mathrm{M}^{-1 \rho}} & \left|u(y)-u_{0}\right| d y \\
& \leqslant \frac{1}{|\mathrm{~S}(x, \rho)|} \int_{\mid y^{*}-\mathbf{T}_{x \mid<\rho}}\left|u\left(\mathrm{~T}^{-1} y^{*}\right)-u_{0}\right| d y^{*} \\
& \leqslant \frac{\mathrm{M}^{2 n}}{\left|\mathrm{~S}\left(x, \mathrm{M}_{\rho}\right)\right|} \int_{\left|x-y_{\mid<\mathrm{M}}\right|}\left|u(y)-u_{0}\right| d y,
\end{aligned}
$$

from which the proposition follows by letting $\rho \downarrow 0$.
The application of the corrected function to Bessel potentials is based on the following proposition.

[^1]6) Let $d \mu$ be a signed Borel measure such that
$$
\int \mathrm{G}_{\alpha}(x-y) d \mu(y)
$$
is defined and finite for at least one $x \in \mathrm{R}^{n}$. Put
$$
u(x)=\int \mathrm{G}_{\alpha}(x-y) d \mu(y)
$$
wherever the integral exists and is finite. Then $u \in \mathrm{~L}_{\mathrm{loc}}^{1}\left(\mathrm{R}^{n}\right)$ and $u^{\mathrm{L}}$ is an extension of $u$.

Proof. - By Prop. 1, §6, II, we have $u \in \mathrm{~L}_{\text {loc }}^{1}\left(\mathrm{R}^{n}\right)$ and for $\alpha>n, u^{L}(x) \equiv u(x)$.

For $\alpha \leqq n$ let $x$ be a point where $u(x)$ is defined. By (4.2), II it follows that $d \mu$ has no point mass at $x$. Hence

$$
\begin{aligned}
& \frac{1}{|\mathrm{~S}(x, \rho)|} \int_{\mathrm{S}(x, \rho)}|u(y)-u(x)| d y \\
& \quad=\frac{1}{|\mathrm{~S}(x, \rho)|} \int_{\mathrm{S}(x, \rho)}\left|\int_{\mathrm{R}^{n}}\left[\mathrm{G}_{\alpha}(y-z)-\mathrm{G}_{\alpha}(x-z)\right] d \mu(z)\right| d y \\
& \quad \leqslant \int_{\mathbf{R}^{n}}\left[\frac{1}{|\mathrm{~S}(x, \rho)|} \int_{\mathrm{S}(x, \rho)}\left|\mathrm{G}_{\alpha}(y-z)-\mathrm{G}_{\alpha}(x-z)\right| d y\right]|d \mu|(z) .
\end{aligned}
$$

For $x \neq z$, the function in square brackets converges pointwise to 0 as $\rho \downarrow 0$ by (4.1), II and is majorated by a constant times $\mathrm{G}_{\alpha}(x, z)$ for $\rho$ sufficiently small by Prop. 1), §4, II. The result follows by the dominated convergence theorem.
$6^{\prime}$ ) If $u \in \mathrm{P}^{\alpha}$ then $u^{\mathrm{L}} \in \mathrm{P}^{\alpha}$ and $u(x)=u^{\mathrm{L}}(x)$ exc. $\mathfrak{A}_{2 \alpha}$.
Proof. - If $u \in \mathrm{P}^{\alpha}$ then exc. $\mathfrak{A}_{2 \alpha} u(x)=\int \mathrm{G}_{\alpha}(x-y) f(y) d y$, $f \in \mathrm{~L}^{2}\left(\mathrm{R}^{n}\right)$ and the result follows by setting $d \mu(y)=f(y) d y$ in Prop. 6).

The last proposition together with the previous ones leads immediately to the following theorems.

Theorem I. - If u is equipalent to a function in $\mathrm{P}^{\alpha}\left(\right.$ or $\mathrm{P}_{\text {ioc }}^{\alpha}(\mathrm{D})$ ) then for any $\varphi, u^{\varphi} \in \mathrm{P}^{\alpha}\left(\right.$ or $\left.\in \mathrm{P}_{\text {loc }}^{\alpha}(\mathrm{D})\right)$.

Theorem II. - If $u \in \mathrm{P}^{\alpha}$ and $j$ is any system of indices with $|j| \leqslant \alpha$, then for any $\varphi$

$$
\mathrm{D}_{j} u(x)=\lim _{\rho \nsim 0} \int i^{i j \mid \xi \xi} e^{i(x, \xi)} \hat{u}(\xi) \hat{\varphi}(\rho \xi) d \xi \quad \text { exc. } \mathfrak{A}_{2 \alpha-2|j|} .
$$

Remark 1. - The corrected function $u^{\text {¢ }}$ of some function $u$ can be characterized intrinsically by the fact that

$$
\left(u^{\varphi}\right)^{\varphi}=u^{\varphi} .
$$

Therefore when we say that $\varphi$ is a corrected function it means that $\varphi=\varphi$ for some $\varphi$. Usually the particular choice of $\varphi$ is immaterial and will not be mentioned.

## 1. The space $\mathbf{P}^{\alpha}(\mathbf{D})$.

$\mathrm{P}^{\alpha}(\mathrm{D})$ is the space (defined in Chap. I, §5) of all restrictions to D of functions in $\mathrm{P}^{\alpha}$, with the norm

$$
\begin{equation*}
\|u\|_{\alpha, \mathbf{D}}=\min \|\tilde{u}\|_{\alpha} \tag{1.1}
\end{equation*}
$$

the minimum being taken over all $\tilde{u} \in \mathrm{P}^{\alpha}$ such that $\tilde{u}=u$ on D except on a subset of D of $2 \alpha$-capacity 0 . By Prop. 1) of Chap. I, $\S 5, \mathrm{P}^{\alpha}(\mathrm{D})$ is a complete functional space relative to the class of subsets of $D$ of $2 \alpha$-capacity 0 . Throughout the chapter it is assumed that D is an open set.

1) $\mathrm{P}^{\alpha}(\mathrm{D})$ is the perfect functional completion of the class of restrictions to D of functions in $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$.

Proof. - The proposition follows from the general properties of functional completions.
2) $\mathrm{P}^{\alpha}(\mathrm{D}) \subset P_{\text {toc }}^{\alpha}(\mathrm{D})$.
3) If $\beta<\alpha$, then $\mathrm{P}^{\beta}(\mathrm{D}) \supset \mathrm{P}^{\alpha}(\mathrm{D})$ and $\|u\|_{\beta, \mathrm{D}} \leqslant\|u\|_{\alpha, \mathrm{D}}$.

Moreover, if D is bounded then $\|u\|_{\beta, \mathrm{D}}$ is completely continuous with respect to $\|u\|_{\alpha, \mathrm{D}}$.

Proof. - The first statement is obvious from the fact that $\mathrm{P}^{\beta} \supset \mathrm{P}^{\alpha}$ and $\|u\|_{\beta} \leqslant\|u\|_{\alpha}$.

The statement about complete continuity is proved as follows. For each $u \in \mathrm{P}^{\alpha}(\mathrm{D})$, let $\tilde{u} \in \mathrm{P}^{\alpha}$ be the extension of $u$ with $\|\tilde{u}\|_{\alpha}=\|u\|_{\alpha, \mathrm{D}}$. Let $\varphi$ be a function of class $\mathrm{C}_{0}^{\infty}$ which is equal to 1 on D. By Prop. 6), §2, II, there is a constant $c$ such that

$$
\|\varphi \tilde{u}\|_{\alpha} \leqslant c\|\tilde{u}\|_{\alpha}=c\|u\|_{\alpha, \mathrm{D}} .
$$

If $\left\{u_{n}\right\}$ is a bounded sequence in $\mathrm{P}^{\alpha}(\mathrm{D})$, then $\left\{\varphi \tilde{u}_{n}\right\}$ is a bounded sequence in $\mathrm{P}^{\alpha}$, and each term vanishes outside of a fixed
compact. Therefore, by Prop. 4) § 2, II, there is a subsequence $\left\{\varphi \tilde{u}_{n_{k}}\right\}$ which converges in $\mathrm{P} \beta$. The sequence $\left\{u_{n_{k}}\right\}$ must then converge in $\mathrm{P}^{\beta}(\mathrm{D})$ since

$$
\left\|u_{n_{k}}-u_{n_{l} \|}\right\|_{\beta, \mathrm{D}} \leqslant\left\|\varphi \tilde{u}_{n_{k}}-\varphi \tilde{u}_{n_{k}}\right\| \|_{\beta} .
$$

$\varphi$ will be called a multiplier of order $k$ on D (an open set) with Lipschitz constant M if $\varphi \in \mathrm{C}^{(k, 1)}(\mathrm{D}) \cap \mathrm{L}^{\infty}(\mathrm{D})$ (if $k=-1$ we only require that $\varphi \in L^{\infty}(\mathrm{D})$ ) with common Lipschitz constant M for all derivatives of order $\leqslant k$ and $|\varphi|_{\infty, \mathrm{D}} \leqslant \mathrm{M}$.
4) If $u \in \mathrm{P}^{\alpha}(\mathrm{D})$ and $\varphi$ is a multiplier of order $\alpha^{*}$ on $\mathrm{R}^{n}$ with Lipschitz constant M then $\varphi u \in \mathrm{P}^{\alpha}(\mathrm{D})$ and $\|\uparrow u\|_{\alpha, \mathrm{D}} \leqslant c \mathrm{M}\|u\|_{\alpha, \mathrm{D}}$ where $c$ depends only on $\alpha^{*}$ and $n$.

Proof. - If $\tilde{u} \in \mathrm{P}^{\alpha}$ is such that $\tilde{u}=u$ on D and $\|\tilde{u}\|_{\alpha}=\|u\|_{\alpha, \mathrm{D}}$ then by (2.4) of Chap. II, and by the definition (1.1) ( ${ }^{4}$ )

$$
\|\varphi u\|_{\alpha, \mathrm{D}} \leqslant\|\varphi u\|_{\alpha} \leqslant c \mathrm{M}\|\tilde{u}\|_{\alpha}=c \mathrm{M}\|u\|_{\alpha, \mathrm{D}}
$$

5) If $u \in \mathrm{P}^{\alpha}(\mathrm{D})$ and $m$ is an integer $\leqslant \alpha$, then for $|i| \leqslant m$, $\mathrm{D}_{i} u \in \mathrm{P}^{\alpha-m}(\mathrm{D})$ and

$$
\begin{equation*}
\sum_{k=0}^{m}\binom{m}{k} \sum_{|i|=k}\left\|\mathrm{D}_{i} u\right\|_{\alpha-m, \mathrm{D}}^{2} \leqslant\|u\|_{\alpha, \mathrm{D}}^{2} \tag{1.2}
\end{equation*}
$$

Proof. - Take $\tilde{u} \in \mathrm{P}^{\alpha}$ such that $\tilde{u}=u$ on D and $\|\tilde{u}\|_{\alpha}=\|u\|_{\alpha, \mathrm{D}}$ and use formula (7.1) of Chap. II ${ }^{5}$ ).

The next proposition deals with restrictions of functions in $\mathrm{P}^{\alpha}(\mathrm{D})$ to the intersection of D with a $k$-dimensional hyperplane $\mathrm{R}^{k}$. In accordance with the conventions used earlier, quantities associated with $\mathrm{R}^{k}$ are primed.
6) If $\mathrm{D} \cap \mathrm{R}^{k}$ is non-empty, and if $2 \alpha>n-k$, then
(a) if $u \in \mathrm{P}^{\alpha}(\mathrm{D})$, then $u^{\prime} \in \mathrm{P}^{\alpha-\frac{n-k}{2}}\left(\mathrm{D} \cap \mathrm{R}^{k}\right)$ and

$$
\begin{equation*}
\left\|u^{\prime}\right\|_{\alpha-\frac{n-k}{2}, \mathrm{D} \mathrm{\cap R}}{ }^{\prime 2} \leqq \frac{\Gamma\left(\alpha-\frac{n-k}{2}\right)}{2^{n-k} \pi^{\frac{n-k}{2}} \Gamma(\alpha)}\|u\|_{\alpha, \mathrm{D}}^{2} \tag{1.3}
\end{equation*}
$$

${ }^{(4)}$ The constant $c$ is not the same as the one in (2.4) Chap. II, since we are using $\left\|\|_{\alpha}\right.$ instead of | $\left.\right|_{\alpha}$.
$\left(^{5}\right)$ If the boundary of $D$ is irregular, the reverse inequality in (1.2) does not hold, even when the left side is multiplied by an arbitrarily large constant.
(b) If $u^{\prime} \in \mathrm{P}^{\alpha-\frac{n-k}{2}}\left(\mathrm{D} \cap \mathrm{R}^{k}\right)$ then there exists $u \in \mathrm{P}^{\alpha}(\mathrm{D})$ such that the restriction of $u$ to $\mathrm{D} \cap \mathrm{R}^{k}$ is $u^{\prime}$ and such that equality holds in (1.3).

Proof. - Theorems $\mathrm{I} a$ and $\mathrm{I} b, \S 8$, Chap. II.
7) There is a constant $c$ such that if, for

$$
q=0,1, \ldots, r<\alpha-\frac{1}{2}, \quad u_{q}^{\prime} \in \mathrm{P}^{\alpha-q-\frac{1}{2}}\left(\mathrm{D} \cap \mathrm{R}^{n-1}\right)
$$

then there is a function $u \in \mathrm{P}^{\alpha}(\mathrm{D})$ such that $\left(\frac{\partial^{q} u}{\partial x_{n}^{q}}\right)=u_{q}^{\prime}$ except on a subset of $\mathrm{D} \cap \mathrm{R}^{n-1}$ of ( $2 \alpha-2 q-1$ )-capacity 0 in $\mathrm{R}^{n-1}$ and

$$
\begin{equation*}
\|u\|_{\alpha, \mathrm{D}}^{2} \leqslant c \sum_{q=0}^{r}\left\|u_{q}^{\prime}\right\|_{\alpha-q-\frac{1}{2}, \mathrm{D}_{\mathrm{NR}^{n-1}}^{\prime 2}} \tag{1.4}
\end{equation*}
$$

Proof. - Theorem Ic, § 8, II.
We will use the general notation: If U is an open set in $\mathrm{R}^{n}$ then $\mathrm{U}^{\delta}=\left[x: \operatorname{dist} .\left(x, \mathrm{R}^{n}-\mathrm{U}\right)>\delta\right], \delta>0$. It is easy to see that $U^{\delta}$ has the following properties: $\left|\partial\left(U^{\grave{ }}\right)\right|=0\left(^{6}\right)$, $\left(\mathrm{U}^{\delta_{1}}\right)^{\delta_{2}}=\mathrm{U}^{\delta_{4}+\delta_{2}} \quad$ and if $\mathrm{U}=\mathrm{R}^{n}$, then $\mathrm{U}^{\delta}=\mathrm{U}$.

Lemma 1. - Let U be an open set in $\mathrm{R}^{n}$ and A a closed subset of $\mathrm{U}^{\delta}$, then there exists a function $\varphi \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right)$ such that

$$
0 \leqslant \varphi(x) \leqslant 1
$$

everywhere, $\varphi(x)=1$ on A, and $\varphi(x)=0$ outside of U. Furthermore, $\left|\mathrm{D}_{i} \varphi(x)\right| \leqslant \mathrm{C}_{|i|} \delta^{-|i|}$ where $\mathrm{C}_{m}$ is a constant depending only on $m$ and $n$.

Proof. - Consider the characteristic function $\chi(x)$ of the $\delta / 3$ neighborhood of A. Then the regularization ( ${ }^{7}$ ) $\chi_{\delta / 3}(x)$ of $\chi$ by $e(x)$ satisfies all the requirements of the lemma and

$$
\mathrm{C}_{m}=\frac{\omega_{n}}{n} 3^{m} \sup _{|i|=m}\left|\mathrm{D}_{i} e(x)\right| .
$$

${ }^{(6)}$ If $x \in \partial\left(U^{\delta}\right)$ there exists a $y \in \partial \mathrm{U}$ such that $x \in \partial \mathrm{~S}(y, \delta)$. Hence

$$
\varlimsup_{r \Downarrow 0}\left|\mathrm{~S}(x, r) \cap \partial\left(\mathrm{U}^{\curlywedge}\right)\right| /|\mathrm{S}(x, r)| \leqslant \frac{1}{2}
$$

for all $x \in \partial\left(\mathrm{U}^{\delta}\right)$, i.e. $\partial\left(\mathrm{U}^{\delta}\right)$ is at each point of upper density $\leqslant \frac{1}{2}$. By a classical
theorem of Lebesgue if follows that $\left|\partial\left(\mathrm{U}^{\delta}\right)\right|=0$. theorem of Lebesgue if follows that $\left|\partial\left(\mathrm{U}^{\curlywedge}\right)\right|=0$.
${ }^{7}{ }^{7} \mathrm{Cf} . \S 2$, II.

We recall that a transformation of $D^{*}$ into $D$ is of class $\mathrm{C}^{(m, 1)}\left(\mathrm{D}^{*}\right)$ with Lipschitz constant M if each of its coordinate functions is of class $\mathrm{C}^{(m, 1)}\left(\mathrm{D}^{*}\right)$ with common Lipschitz constant M for all derivatives of order $\leqslant m$. Finally, a homeomorphism T of $\mathrm{D}^{*}$ onto D is of class $\mathrm{C}^{(m, 1)}$ with Lipschitz constant M if T and $\mathrm{T}^{-1}$ are transformations of class $\mathrm{C}^{(m, 1)}\left(\mathrm{D}^{*}\right)$ and $\mathrm{C}^{(m, 1)}(\mathrm{D})$ respectively with common Lipschitz constant M .
8) Let T be a homeomorphism of class $\mathrm{C}^{\left({ }^{*}, 1\right)}$ with Lipschitz constant M of an open $\mathrm{U}^{*}$ on an open set U and let $\overline{\mathrm{D}} \subset \mathrm{U}^{\delta}$. Then if $u \in \mathrm{P}^{\alpha}(\mathrm{D})$,

$$
\mathrm{T}^{*} u\left(x^{*}\right)=u\left(\mathrm{~T} x^{*}\right) \in \mathrm{P}^{\alpha}\left(\mathrm{D}^{*}\right) \quad\left(\mathrm{D}^{*}=\mathrm{T}^{-1}(\mathrm{D})\right)
$$

and $\left\|\mathrm{T}^{*} u\right\|_{\alpha, \mathrm{D}^{*}} \leqslant \mathrm{C}^{-\alpha} \mathrm{M}^{\alpha+3 n / 2}\|u\|_{\alpha, \mathrm{D}}$ where C depends only on $\alpha^{*}$ and $n$.

Proof. - It is clear that $\overline{\mathrm{D}}^{*} \subset\left(\mathrm{U}^{*}\right)^{\delta^{*}}$ where $\delta^{*}=\mathrm{M}^{-1} \delta$. Let $\tilde{u} \in \mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ be the extension of $u$ to $\mathrm{R}^{n}$ with $\|\tilde{u}\|_{\alpha, \mathrm{R}^{n}}=\|u\|_{\alpha, \mathrm{D}}$ and for $x^{*} \in \mathrm{U}^{*}$ let $\tilde{u}^{*}\left(x^{*}\right)=\tilde{u}\left(\mathrm{~T} x^{*}\right)$. By Prop. 3, § 9, II, $\tilde{u}^{*} \in \mathrm{P}_{\mathrm{loc}}^{\alpha}\left(\mathrm{U}^{*}\right)$.

Since $\overline{\mathrm{D}}^{*} \subset\left(\left(\mathrm{U}^{*}\right)^{\delta^{*} / 2}\right)^{\delta^{*} / 2}$, by Lemma 1 there exists a function $\varphi^{*}$ such that $\varphi^{*}\left(x^{*}\right)=1$ on $\mathrm{D}^{*}, \varphi^{*}\left(x^{*}\right)=0$ outside of $\left(\mathrm{U}^{*}\right)^{\delta^{* / 2}}$, and its derivatives satisfy $\left|\mathrm{D}_{i}^{*} \varphi^{*}\left(x^{*}\right)\right| \leqslant \mathrm{C}_{|i|}\left(\delta^{*}\right)^{-|i|}$ where $\mathrm{C}_{m}$ depends only on $m$ and $n$.

Therefore, if $\varphi \mathrm{pe}$ extend $\varphi^{*} \tilde{u}^{*}$ by zero outside $\mathrm{U}^{*}$,

$$
\varphi^{*} \tilde{u}^{*} \in \mathrm{P}_{\mathrm{loc}}^{\alpha}\left(\mathrm{R}^{n}\right) ;
$$

and it is clear, that for an integer $m$ :

$$
\begin{aligned}
d_{m}\left(\varphi^{*} \tilde{u}^{*}\right) & =\sum_{\mid i=m} \int_{\mathrm{R}^{n}}\left|\mathrm{D}_{i}^{*} \varphi^{*} u^{*}\left(x^{*}\right)\right|^{2} d x^{*} \\
& \leqslant c \delta^{-2 m} \mathrm{M}^{n+2 m} \sum_{l \leqslant m} d_{l}(\tilde{u}),
\end{aligned}
$$

$c$ depending only on $n$ and $m$.
For non-integral values of $\alpha$ an evaluation similar to that in the proof of Prop. 4), § 9,II, yields

$$
d_{\alpha}\left(\varphi^{*} \tilde{u}^{*}\right) \leqslant c \delta^{-2 \alpha} \mathrm{M}^{2 \alpha+3 n}\left(d_{\alpha}(\tilde{u})+\sum_{l \leqslant \alpha^{*}} d_{l}(\tilde{u})\right)
$$

where $c$ depends only on $\alpha^{*}$ and $n$, hence $\varphi^{*} \tilde{u}^{*} \in \mathrm{P}^{\alpha}$.

Since $\mathrm{T}^{*} u\left(x^{*}\right)=\varphi^{*} u^{*}\left(x^{*}\right)$ for $x^{*} \in \mathrm{D}^{*}$, it follows that

$$
\begin{aligned}
\left\|\mathrm{T}^{*} u\right\|_{\alpha, \mathrm{D}^{*}} & \leqslant\left\|\varphi^{*} \tilde{u}^{*}\right\|_{\alpha, \mathrm{R}^{n}} \\
& \leqslant c \delta^{-\alpha} \mathrm{M}^{\alpha+\frac{3 n}{2}}\|\tilde{u}\|_{\alpha, \mathrm{R}^{n}} \\
& =c \delta^{-\alpha} \mathrm{M}^{\alpha+\frac{3 n}{2}}\|u\|_{\alpha, \mathrm{D}},
\end{aligned}
$$

where $c$ depends only on $n$ and $\alpha^{*}$, from which the proposition follows. Next is a special result for $0 \leqslant \alpha \leqslant 1$.
9) If $u$ is of class $\mathrm{C}^{(0,1)}$ on D and panishes outside of a bounded subset of D , then $u \in \mathrm{P}^{\alpha}(\mathrm{D})$ for $0 \leqslant \alpha \leqslant 1$.

Proof. - Suppose $u$ vanishes outside $\mathrm{S}(0, r) \cap \mathrm{D}$, and let $\varphi$ be a function in $\mathrm{C}^{(0,1)}\left(\mathrm{R}^{n}\right)$ which is 1 on $\mathrm{S}(0, r)$ and is 0 outside $\mathrm{S}(0, r+1)$. It is well known that each function $u$ of class $\mathrm{C}^{(0,1)}$ on a subset of $\mathrm{R}^{n}$ has an extension $\tilde{u}$ of class $\mathrm{C}^{(0,1)}$ on $\mathrm{R}^{n}$. By Prop. 6), § 2, II, $\varphi \tilde{u} \in \mathrm{P}^{\alpha}$, and obviously $u$ is the restriction to D of $\varphi \tilde{u}$, so $u \in \mathrm{P}^{\alpha}(\mathrm{D})$.

Corollary. - If D is bounded, then for $0 \leqslant \alpha \leqslant 1$, $\mathrm{P}^{\alpha}(\mathrm{D}) \supset \mathrm{C}^{(0,1)}(\mathrm{D})$.

## 2. The space $\check{\mathbf{P}}^{\alpha}(\mathbf{D})$.

The standard $\alpha$-norm over $\mathrm{D},|u|_{\alpha, \mathrm{D}}$, is defined by direct formula in (2.1) below. The space $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ is defined to be the subspace of $\mathrm{P}_{\text {loc }}^{\alpha}(\mathrm{D})$ on which the $\alpha$-norm is finite. The definition is such that $\check{\mathrm{P}}^{\alpha}(\mathrm{D}) \supset \mathrm{P}^{\alpha}(\mathrm{D})$ and when the boundary of D satisfies suitable regularity conditions the two are equal $\left(^{8}\right)$. This will give the intrinsic characterization of functions in $\mathrm{P}^{\alpha}(\mathrm{D})$.

Now for the definition. For $u \in \mathrm{P}_{\text {loc }}^{\alpha}(\mathrm{D})$

$$
\begin{equation*}
|u|_{0, \mathbf{D}}^{2}=\int_{\mathbf{D}}|u(x)|^{2} d x \tag{2.1a}
\end{equation*}
$$

(2.1b) For $0<\alpha<1$,

$$
\begin{aligned}
|u|_{\alpha, \mathrm{D}}^{2} & =|u|_{0, \mathrm{D}}^{2} \\
& +\frac{1}{\mathrm{C}(n, \alpha) \mathrm{G}_{2 n+2 \alpha}(0)} \int_{\mathbf{D}} \int_{\mathbf{D}} \frac{\mathrm{G}_{2 n+2 \alpha}(x-y)}{|x-y|^{n+2 \alpha}}|u(x)-u(y)|^{2} d x d y
\end{aligned}
$$

${ }^{(8)}$ A large part of the rest of this paper is directed towards the proof of this fact which is not simple unless $\partial \mathrm{D}$ is of class $\mathrm{C}\left(\alpha^{*}, 1\right)$.
where $\mathrm{C}(n, \alpha)$ is defined by (1.3), II. For arbitrary $\alpha \geqslant 0$, let $m=[\alpha]\left({ }^{9}\right)$ and $\beta=\alpha-m$, then

$$
\begin{equation*}
|u|_{\alpha, \mathrm{D}}^{2}=\sum_{k=0}^{m}\binom{m}{k} \sum_{|i|=k}\left|\mathrm{D}_{i} u\right|_{\rho, \mathrm{D}}^{2} . \tag{2.1c}
\end{equation*}
$$

We also introduce a norm equivalent to $|u|_{\alpha, \mathrm{D}}$, the approximate $\alpha$-norm, $\mid u\rceil_{\alpha, \mathrm{D}}$ (cf. Prop. 3) below). This norm is introduced because it is simpler and easier to handle in many of the proofs. The main distinction between the standard and approximate norms is their behavior as $\alpha \downarrow m, m$ an integer. For more details see §4. The motivation for calling $|u|_{\alpha, \mathrm{D}}$ the standard $\alpha$-norm is the fact that if $\mathrm{D}=\mathrm{R}^{n}$ then

$$
|u|_{\alpha, \mathrm{D}}=\|u\|_{\alpha}
$$

(cf. Prop. 2) below).
For $u \in \check{P}^{\beta}(D), 0 \leqslant \beta \leqslant 1$, we define the Dirichlet integral of order $\beta$ (cf. (1.2) and (1.4) of II) by

$$
\begin{equation*}
d_{0, \mathrm{D}}(u)|=u|_{0, \mathrm{D}}^{2}, \quad d_{1, \mathrm{D}}(u)=|u|_{1, \mathrm{D}}^{2}-|u|_{0, \mathrm{D}}^{2}=\sum_{l=1}^{n} \int_{\mathbf{D}}\left|\frac{\partial u}{\partial x_{l}}\right|^{2} d x \tag{2.2}
\end{equation*}
$$

and for

$$
0<\beta<1, \quad d_{\beta, \mathrm{D}}(u)=\frac{1}{\mathrm{C}(n, \beta)} \int_{\mathrm{D}} \int_{\mathrm{D}} \frac{|u(x)-u(y)|^{2}}{|x-y|^{n+2 \beta}} d x d y .
$$

The approximate $\alpha$-norm for $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ is

$$
\begin{equation*}
\mid u\rceil_{0, \mathrm{D}}^{2}=d_{0, \mathbf{D}}(u)=|u|_{0, \mathrm{p}}^{2} ; \tag{2.3a}
\end{equation*}
$$

for

$$
0<\alpha<1, \quad|u\rangle_{\alpha, \mathrm{D}}^{2}=\mid u 7_{0, \mathrm{D}}^{2}+d_{\alpha, \mathrm{D}}(u) .
$$

For arbitrary $\alpha \geqslant 0$ we let $m=[\alpha]$ and $\beta=\alpha-m$, then

$$
\begin{equation*}
\mid u\rceil_{\alpha, \mathrm{D}}^{2}=\sum_{k=0}^{m}\binom{m}{k} \sum_{|i|=k}\left|\mathrm{D}_{i} u\right\rangle_{\rho, \mathrm{D}}^{2} . \tag{2.3b}
\end{equation*}
$$

Remark 1. - If $u \in \mathrm{P}_{\mathrm{loc}}^{\alpha}(\mathrm{D})$ then its distribution derivatives of order $\leqslant \alpha$ are equal to its ordinary derivatives. As a converse to this we have:

1) If $u$ is a distribution on D such that each distribution
${ }^{(9)}[\alpha]$ is the greatest integer $\leqslant \alpha$.
derisative $\mathrm{D}_{i} u \in \mathrm{~L}_{\mathrm{loc}}^{1}(\mathrm{D})$ for $|i| \leqslant m=[\alpha]$ and

$$
\sum_{k=0}^{m}\binom{m}{k} \sum_{|i|=k}\left|\mathrm{D}_{i} u\right|_{\beta, \mathrm{D}}^{2}<\infty, \quad \beta=\alpha-m
$$

then the correction of $u$ is in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$.
Proof. - By Prop. 7), § 2, II (localized) $u$ is equal a.e. to a function $\varphi$ in $P_{\text {loc }}^{\alpha}(\mathrm{D})$. By Theorem $1, \S 0, u^{\mathrm{L}} \in \mathrm{P}_{\mathrm{loc}}^{\alpha}(\mathrm{D})$ and the proposition is proved.

For the same reason we have:
$1^{\prime}$ ) If $u$ is a corrected function in $\check{\mathrm{P}}^{m}(\mathrm{D}), m=[\alpha]$, and $|u|_{\alpha, \mathrm{D}}<\infty$ then $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$.
2) If $u \in \mathrm{P}^{\alpha}$ then $|u|_{\alpha, \mathrm{R}^{n}}=\|u\|_{\alpha}$.

Proof. - By the last formula in (1.10), II it is sufficient to consider $0 \leqslant \alpha<1$ and if $\alpha=0$, the proof is trivial. Now suppose $0<\alpha<1$.

It can be shown by a simple rewriting of the second formula in (1.10), II (cf. the development in §4, II) that

$$
\begin{aligned}
& \|u\|_{\alpha}^{2}=\frac{1}{\mathrm{C}(n+1, \alpha)} \times \\
& \int_{-\infty}^{+\infty} \int_{\mathbf{R}^{n}} \int_{\mathrm{R}^{n}} \frac{|u(x)+u(y)|^{2} \sin ^{2} \frac{1}{2} z_{0}+|u(x)-u(y)|^{2} \cos ^{2} \frac{1}{2} z_{0}}{\left[|x-y|^{2}+z_{0}^{2}\right]^{\frac{n+1+2 \alpha}{2}}} d x d y d z_{0} \\
& =\frac{1}{\mathrm{C}(n+1, \alpha)} \times \\
& \int_{-\infty}^{+\infty} \int_{\mathbf{R}^{n}} \int_{\mathbf{R}^{n}} \frac{2\left(|u(x)|^{2}+|u(y)|^{2}\right) \sin ^{2} \frac{1}{2} z_{0}+|u(x)-u(y)|^{2} \cos z_{0}}{\left[|x-y|^{2}+z_{0}^{2}\right]^{\frac{n+1+2 \alpha}{2}}} d x d y d z_{0} \\
& =\int_{\mathbf{R}^{n}}|u(x)|^{2}\left[\frac{1}{\mathrm{C}(n+1, \alpha)} \int_{-\infty}^{\infty} \int_{\mathbf{R}^{n}}^{\left[|x-y|^{2}+z_{0}^{2}\right]^{\frac{n+1+2 \alpha}{2}}} d y d z_{0}\right] d x \\
& +\int_{\mathbf{R}^{r}} \int_{\mathbf{R}^{n}}|u(x)-u(y)|^{2}\left[\frac{1}{\mathrm{C}(n+1, \alpha)} \int_{-\infty}^{\infty} \frac{\cos z_{0}}{\left[|x-y|^{2}+z_{0}^{2}\right]^{\frac{n+1+2 \alpha}{2}}} d z_{0}\right] d x d y
\end{aligned}
$$

By the integral representation of $\mathrm{C}(n+1, \alpha)$ preceding (1.3), II (and by writing $4 \sin ^{2} \frac{1}{2} z_{0}=\left|e^{i z_{0}}-1\right|^{2}$ ), it is immediately seen that the expression in the square brackets in the first integral is $=1$, and by (2.8), II,
$\int_{-\infty}^{\infty} \frac{\cos z_{0}}{\left[|x-y|^{2}+z_{0}^{2}\right]^{\frac{n+1+2 \alpha}{2}}} d z_{0}=\frac{2 \pi}{|x-y|^{n+2 \alpha}} \mathrm{G}_{n+1+2 \alpha}^{(1)}(|x-y|)$
where $G_{n+1+2 \alpha}^{(1)}$ is the kernel for $\mathrm{R}^{1}$. Transforming this kernel by (4.1), II to the kernel for $\mathrm{R}^{n}$ we have finally,

$$
\begin{aligned}
\|u\|_{\alpha}^{2}=\int_{\mathbf{R}^{n}}|u|^{2} d x & +\frac{\Gamma(n+\alpha) \pi^{\frac{n}{2}+\frac{1}{2}} \omega_{n}}{\Gamma\left(\alpha+\frac{n+1}{2}\right) \mathrm{C}(n+1, \alpha)} \\
& \times \int_{\mathbf{R}^{n}} \int_{\mathbf{R}^{n}} \frac{\mathrm{G}_{2 n+2 \alpha}(x-y)}{|x-y|^{n+2 \alpha}}|u(x)-u(y)|^{2} d x d y
\end{aligned}
$$

By (1.3), II, and (4.2), II, it is checked immediately that the constant in front of the second integral is

$$
\left[\mathrm{G}_{2 n+2 \alpha}(0) \mathrm{C}(n, \alpha)\right]^{-1}
$$

which, after comparison with (2.1), completes the proof.
3) If $u \in \check{\mathrm{P}}^{m}(\mathrm{D}), m=[\alpha]$, then

$$
\begin{equation*}
\left.\left.2^{-1 / 2} \mid u\right\rceil_{\alpha, \mathrm{D}} \leqslant|u|_{\alpha, \mathrm{D}} \leqslant \mid u\right\rceil_{\alpha, \mathrm{D}} \tag{2.4}
\end{equation*}
$$

and

$$
0 \leqslant \mid u\rceil_{\alpha, \mathrm{D}}^{2}-|u|_{\alpha, \mathrm{D}}^{2} \leqslant|u|_{m, \mathrm{D}}^{2}\left({ }^{(\mathbf{0}}\right) .
$$

Remark 2. - The second member in the inequality is to be interpreted as the integral of the difference of its integrands if the norms are infinite.

Proof. - By (2.1c) and (2.3b), it is clear that we may assume $0 \leqslant \alpha<1$. Our hypothesis is now $u \in \check{\mathrm{P}}(\mathrm{D})$. Put $\tilde{u}(x)=u(x)$ on D and $=0$ on $\mathrm{R}^{n}-\mathrm{D}$, and let $u_{n} \in \mathrm{P}^{\alpha}$ be such that

$$
\left\|u-u_{n}\right\|_{0}<\frac{1}{n}\left(\mathrm{P}^{\alpha} \text { is dense in } \mathrm{P}^{0}\right) .
$$

$\left.{ }^{(10}\right)$ These inequalities are best possible for $\alpha$ not an integer, see example $1, \S 13$

Consider the function $F(\rho)=1+\rho^{2 \alpha}-\left(1+\rho^{2}\right)^{\alpha}$; it is an increasing function of $\rho$ for $\rho \geqslant 0$ and $F(0)=0, F(\infty)=1$.

By (2.1), (2.2), and the fact that $\mathrm{G}_{2 n+2 \alpha}(x)$ is a decreasing function of $|x|$ (see § 4, II), we have

$$
\begin{aligned}
& 0 \leqslant|u\rangle_{\alpha, \mathrm{D}}^{2}-|u|_{\alpha, \mathrm{D}}^{2}=\frac{1}{\mathrm{G}_{2 n+2 \alpha}(0) \mathrm{C}(n, \alpha)} \times \\
& \quad \int_{\mathrm{D}} \int_{\mathrm{D}} \frac{\mathrm{G}_{2 n+2 \alpha}(0)-\mathrm{G}_{2 n+2 \alpha}(x-y)}{|x-y|^{n+2 \alpha}}|u(x)-u(y)|^{2} d x d y \\
& \leqslant \frac{1}{\mathrm{G}_{2 n+2 \alpha}(0) \mathrm{C}(n, \alpha)} \times \\
& \quad \int_{\mathrm{R}^{n}} \int_{\mathbf{R}^{n}} \frac{\mathrm{G}_{2 n+2 \alpha}(0)-\mathrm{G}_{2 n+2 \alpha}(x-y)}{|x-y|^{n+2 \alpha}}|\tilde{u}(x)-\tilde{u}(y)|^{2} d x d y .
\end{aligned}
$$

Applying Fatou's lemma, (1.2) and (1.9) of II, and the remark concerning $F(\rho)$ we have from this inequality

$$
\begin{aligned}
0 & \leqslant|u\rangle_{\alpha, \mathrm{D}}^{2}-|u|_{\alpha, \mathrm{D}}^{2} \leqslant \lim _{m} \inf \left[\left|u_{m} 7_{\alpha, \mathrm{R}^{n}}^{2}-\left|u_{m}\right|_{\alpha, \mathrm{R}^{n}}^{2}\right]\right. \\
& =\liminf _{m}^{\operatorname{lin}} \int_{\mathrm{R}^{n}}\left(1+|\xi|^{2 \alpha}-\left(1+|\xi|^{2 \alpha}\right)\left|\hat{u}_{m}(\xi)\right|^{2} d \xi\right. \\
& \leqslant \liminf _{m} \int_{\mathrm{R}^{n}}\left|\hat{u}_{m}(\xi)\right|^{2} d \xi \\
& =\liminf _{m} \|\left. u_{m}\right|_{0_{0}^{2}} ^{2}=|\tilde{u}|_{0, \mathrm{R}^{n}}^{2}=|u|_{0, \mathrm{D}}^{2} .
\end{aligned}
$$

From this we also have that

$$
|u|_{\alpha, \mathrm{D}}^{2} \leqslant|u|_{0, \mathrm{D}}^{2}+|u|_{\alpha, \mathrm{D}}^{2} \leqslant 2|u|_{\alpha, \mathrm{D}}^{2}
$$

which completes the proof.
Remark 3. - It is easily seen from the above proof that the difference of the two norms converges to 0 as $\alpha \uparrow m+1$ for any $u \in \check{\mathrm{P}}^{m}(\mathrm{D})$, e.g. by noting that $\left(1+|\xi|^{2 \beta}-\left(1+|\xi|^{2}\right)^{\beta}\right) \downarrow 0$ as $\beta \uparrow 1$.
4) $\mathrm{P}^{\alpha}(\mathrm{D}) \subset \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and for $u \in \mathrm{P}^{\alpha}(\mathrm{D}),|u|_{\alpha, \mathrm{D}} \leqslant\|u\|_{\alpha, \mathrm{D}}$.

Proof. - If $\tilde{u}$ is the extension of $u$ in $\mathrm{P}^{\alpha}$ such that

$$
\|\tilde{u}\|_{\alpha}=\|u\|_{\alpha, \mathbf{D}}
$$

then clearly $|u|_{\alpha, \mathrm{D}} \leqslant|\tilde{u}|_{\alpha, \mathrm{R}^{n}}$. The proposition then follows from Prop. 2).
5) If $\alpha \leqslant \gamma$ and $\alpha-[\alpha] \leqslant \gamma-[\gamma]$ then $\check{\mathrm{P}}^{\alpha}(\mathrm{D}) \supset \check{\mathrm{P}}^{\gamma}(\mathrm{D})$
and $\left.\mid u]_{\alpha, \mathrm{D}} \leqslant c \mid u\right\rceil_{\gamma, \mathrm{D}}$ for $u \in \stackrel{\mathrm{P}}{ } \mathrm{Y}(\mathrm{D})$ where $c$ depends only on $n$ and $\gamma-[\gamma]\left({ }^{11}\right)$.

Proof. - Suppose at first that $0<\alpha \leqslant \gamma<1$. We have

$$
\begin{aligned}
d_{\alpha, \mathrm{D}}(u) & =\frac{1}{\mathrm{C}(n, \alpha)}\left\{\int_{|x-y|<1} \int_{\mathbf{D}}+\int_{|x-y|>1} \int_{\mathbf{D}} \frac{|u(x)-u(y)|^{2}}{|x-y|^{n+2 \alpha}} d x d y\right\} \\
& \leqslant \frac{1}{\mathrm{C}(n, \alpha)} \int_{|x-y|<1} \int_{\mid=1} \frac{|u(x)-u(y)|^{2}}{|x-y|^{n+2 \alpha}} d x d y \\
& +\frac{4}{\mathrm{C}(n, \alpha)} \int_{\mathbf{D}}|u(x)|^{2} \int_{\mid \mathcal{D}_{\mathbf{D}}} \frac{d y}{|x-y|^{n+2 \alpha}} d x \\
& \leqslant \frac{\mathrm{C}(n, \gamma)}{\mathrm{C}(n, \alpha)} d_{\gamma, \mathrm{D}}(u)+\frac{2 \omega_{n}}{\alpha \mathrm{C}(n, \alpha)}|u|_{0, \mathrm{D}}^{2},
\end{aligned}
$$

and the inequality is clear in this case from the properties of $\mathrm{C}(n, \alpha)$. For arbitrary $\alpha$ and $\gamma$ we have from the preceding

We shall now introduce some special notation for indicial sets which are used to indicate partial derivatives. An indicial $s e t, s$, is a function defined on a finite well ordered set, the basis of $s$, into the integers. The number of elements in the basis is the length of $s$, written $|s|$, and the set of values is the range of $s$. (The empty set is considered an indicial set, e.g. $\left.\mathrm{D}_{s} u(x) \equiv u(x)\right)$. Since there exists one and only one order preserving mapping of the basis into the integers, $1 \leqslant l \leqslant|s|$, we can represent the indicial set by a sequence of its values on the consecutive elements of its basis, e.g. $s=\left(s_{1}, \ldots, s_{|s|}\right)$. An indicial set consisting of one element with value $k$ will be written ( $k$ ).

We will write $s^{\prime} \subset s$ if the basis of $s^{\prime}$ is a subset of the basis of $s$ with the induced order and the function $s^{\prime}$ is a restriction of the function $s$.

If $s^{\prime}, s^{(l)} \subset s, l=1, \ldots, k$ and the basis of $s^{\prime}$ is a disjoint
(11) Example 2, § 13 shows that this is false in general for $\alpha \leqslant \gamma$ and

$$
\gamma-[\gamma]<\alpha-[\alpha]
$$

unless $D$ is suitably restricted.
union of the bases of $s^{(l)}$ then we write $s^{\prime}=\bigcup_{l} s^{(l)} \equiv \bigcup_{l=1}^{k} s^{(l)}$.
If $s^{\prime} \subset s$ then there exists a unique $s^{\prime \prime}$, written $s-s^{\prime}$, such that $s^{\prime} \cup s^{\prime \prime}=s$.

If $s=\left(s_{1}, \ldots, s_{|s|}\right)$ is an indicial set with $1 \leqslant s_{l} \leqslant n$ then we shall write $\mathrm{D}_{s} u(x) \equiv \frac{\partial^{|s|} u(x)}{\partial x_{s_{i s 1}} \ldots \partial x_{s_{1}}}$ when the right side is defined.

An indicial set reprenseted by $\underset{p}{(k, \ldots, k)}$ will be denoted by $\bigsqcup^{p}(k)$.

Examples of the above notation:
I) Products. Let $u_{m} \in \mathrm{C}^{p}$ and $|i| \leqslant p$. Then

$$
\begin{equation*}
\mathrm{D}_{i}\left(\prod_{m=1}^{l} u_{m}(x)\right)=\Sigma \prod_{m=1}^{l} \mathrm{D}_{i(m)} u_{m}(x) \tag{2.5}
\end{equation*}
$$

where the summation is taken over all $i^{(m)}$ such that

$$
\bigcup_{m=1}^{l} i^{(m)}=i
$$

(Note that some of the $i^{(m)}$ may be empty.) There are exactly $m^{|i|}$ terms in the summation. This formula is also valid when the $u_{m}$ are not necessarily in $\mathrm{C}^{p}$ but where all the required derivatives exist at $x$.
II) Composite functions. Let $u, y_{1}, \ldots, y_{n} \in \mathrm{C}^{p}$ and $|i| \leqslant p$. Let $\varphi(x)=u\left(y_{1}(x), \ldots, y_{n}(x)\right)$ then

$$
\begin{equation*}
\mathrm{D}_{i} \varphi(x)=\Sigma \frac{1}{|t|!} \prod_{m=1}^{|t|} \mathrm{D}_{s(m)} y_{t_{m}}(x)\left(\mathrm{D}_{t} u\right)\left(y_{1}(x), \ldots, y_{n}(x)\right)\left({ }^{12}\right) \tag{2.6}
\end{equation*}
$$

where the summation is taken over all $t=\left(t_{1}, \ldots, t_{t \mid t}\right)$, $1 \leqslant|t| \leqslant|i|, 1 \leqslant t_{l} \leqslant n$, and $s^{(m)}$ such that $\bigcup_{m=1}^{|t|} s^{(m)}=i$;

$$
\left|s^{(m)}\right| \geqslant 1, m=1, \ldots,|t| .
$$

Again, the restriction to the class $\mathrm{C}^{p}$ is not necessary, the formula is valid when all the required derivatives exist at the point $x$ and the corresponding point $y$.

$$
\left.{ }^{12}\right)\left(\mathrm{D}_{t} u\right)\left(y_{1}(x), \ldots, y_{n}(x)\right) \text { means } \mathrm{D}_{t} u(z) \text { evaluated at } z=\left(y_{1}(x), \ldots, y_{n}(x)\right) \text {. }
$$

We also note at this point two easily proved inequalities (essentially equivalent which will be used extensively:

For $0<\beta<1$,
(2.7) $\frac{\omega_{n}}{\beta(1-\beta) \mathrm{C}(n, \beta)} \leqslant 2 n \quad$ and $\left.\frac{2^{1-2 \beta} \omega_{n}}{\beta(1-\beta) \mathrm{C}(n, \beta)} \leqslant 2 n{ }^{(13}\right)$.

The following propositions give some of the properties of multipliers.
6) If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and $\varphi$ is a multiplier of order $\alpha^{*}$ on D sith Lipschitz constant M then $\varphi u \in \breve{\mathrm{P}}^{\alpha}(\mathrm{D})$ and $\left.\left.\mid \varphi u\right\rceil_{\alpha, \mathrm{D}} \leqslant c \mathrm{M} \mid u\right\rceil_{\alpha, \mathrm{D}}$ where $c=\sqrt{2}(1+2 n)^{\frac{m+1}{2}}$ if $\beta>0$ and $=(1+2 n)^{m / 2}$ if $\beta=0$ with $m=[\alpha]$ and $\beta=\alpha-m$.

Proof. - From Prop. 1', § 9, II, it follows that $\varphi u \in P_{\text {ioc }}^{\alpha}(\mathrm{D})$. Following (2.5), we write for $|i| \leqslant m$

$$
\mathrm{D}_{i} \varphi u(x)=\sum_{j \cup k=i} \mathrm{D}_{j} \varphi(x) \mathrm{D}_{k} u(x)
$$

where the summation is taken over $j$ and $k$ such that $j \cup k=i$, and we note that there are $2^{|i|}$ terms in the summation. The inequality for $\beta=0$ follows from this and the properties of multipliers.

For $\beta>0$,

$$
\begin{aligned}
& (2.8) \quad d_{\beta, \mathrm{D}}\left(\mathrm{D}_{i} \varphi u\right) \\
& \leqslant 2^{|i|+1} \sum_{j \cup k=i}\left\{\frac{1}{\mathrm{C}(n, \beta)} \int_{\mathrm{D}} \int_{\mathrm{D}}\left|\mathrm{D}_{j} \varphi(x)\right|^{2} \frac{\left|\mathrm{D}_{k} u(x)-\mathrm{D}_{k} u(y)\right|^{2}}{|x-y|^{n+2 \beta}} d x d y\right. \\
& \left.+\frac{1}{\mathrm{C}(n, \beta)} \int_{\mathrm{D}}\left|\mathrm{D}_{k} u(y)\right|^{2} \int_{\mathrm{D}} \frac{\left|\mathrm{D}_{j} \varphi(x)-\mathrm{D}_{j} \varphi(y)\right|^{2}}{|x-y|^{n+2 \beta}} d x d y\right\} .
\end{aligned}
$$

By the hypotheses on $\varphi$ the first term in the brackets is majorated by $\mathrm{M}^{2} d_{\beta, \mathbf{D}}\left(\mathrm{D}_{k} u\right)$ and the inner integral in the second term is majorated by

$$
\begin{aligned}
& \mathrm{M}^{2} \int_{|x-y|<2}|x-y|^{2-n-2 \beta} d x \\
&+4 \mathrm{M}^{2} \int_{|x-y|>2}|x-y|^{-n-2 \beta} d x \leqslant \mathrm{M}^{2} \frac{2^{1-2 \beta} \omega_{n}}{\beta(1-\beta)}
\end{aligned}
$$

( ${ }^{13}$ ) It can be shown that $2 n$ in the second inequality may be replaced by 2.038 and $n$ for $n=2$ and $n \geqslant 3$ respectively.

By (2.7) it follows that (2.8) is majorated by

$$
2^{|i|+1} \sum_{k \subset i}\left\{\mathrm{M}^{2} d_{\beta, \mathrm{D}}\left(\mathrm{D}_{k} u\right)+2 n \mathrm{M}^{2}\left|\mathrm{D}_{k} u\right|_{0, \mathrm{D}}^{2}\right\}
$$

(the summation is taken over all $k \subset i$ ), hence

$$
\left.\left|\mathrm{D}_{i}(\varphi u) 7_{\beta, \mathrm{D}}^{2} \leqslant 2^{|i|}(1+4 n) \mathrm{M}^{2} \sum_{k \subset i}\right| \mathrm{D}_{k} u\right\rceil_{\beta, \mathrm{D}}^{2} .
$$

The proposition now follows by (2.3b).
7) If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and $\varphi$ is a multiplier of order $\alpha^{*}$ spith Lipschitz constant M and has support in $\mathrm{D}^{\grave{ }}$ then $\varphi u$, extended by 0 outside D , belongs to $\mathrm{P}^{\alpha}$ and

$$
\left.\left.\mid \varphi u\rceil_{\alpha, \mathrm{R}^{n}} \leqslant c \mathrm{M}\{\mid u\rceil_{\alpha, \mathrm{D}}+(1-\beta)^{1 / 2} \delta-\beta \mid u\right\rceil_{m, \mathrm{D}}\right\}
$$

where $m=[\alpha], \beta=\alpha-m$ and $c$ is the constant of Prop. 6).
Remark 4. - We note that if $\beta=0$ (i.e. $\alpha$ is an integer), Prop. 7) is valid when $\varphi$ vanishes in some neighborhood of a D. In this case the second term in the brackets in the inequality is not needed.

Proof. - Clearly $\varphi u \in \mathrm{P}_{\text {ioc }}^{\alpha}\left(\mathrm{R}^{n}\right)$ so we need only prove the inequality. If $\beta=0$ then $\left.\mid \varphi u\rceil_{\alpha, \mathbf{R}^{n}}=\mid \varphi u\right\rceil_{\alpha, D}$ and the inequality follows from Prop. 6). So we assume $\beta>0$. Then for $|i| \leqslant m$, $\left|\mathrm{D}_{i} \varphi u\right\rangle_{\beta, \mathrm{R}^{n}}^{2}=\left|\mathrm{D}_{i} \varphi u\right\rangle_{\beta, \mathrm{D}}^{2}+$

$$
\int_{\mathrm{D}^{\delta}}\left|\mathrm{D}_{i} \varphi u(y)\right|^{2}\left[\frac{2}{\mathrm{C}(n, \beta)} \int_{\mathrm{R}^{n}-\mathrm{D}} \frac{d x}{|x-y|^{n+2} \beta}\right] d y .
$$

By (2.7) it is clear that the square bracketed term is bounded by $\delta^{-2 \beta} \omega_{n} / \beta C(n, \beta) \leqslant 2 n(1-\beta) \delta^{-2 \beta}$. Hence by ( $2.3 b$ ),

$$
|\varphi u\rangle_{\alpha, \mathrm{B}^{n}}^{2} \leqslant|\varphi u\rangle_{\alpha, \mathrm{D}}^{2}+2 n(1-\beta) \delta^{-2 \beta}|\varphi u\rangle_{m, \mathrm{D}}^{2}
$$

and the proof is completed by using Prop. 6).
8) If T is a homeomorphism of class $\mathrm{C}^{\left(\alpha^{*}, 1\right)}, \alpha^{*} \geqslant 0$, with Lipschitz constant $\mathrm{M} \geqslant 1$ of $\mathrm{D}^{*}$ onto D and $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$, then $u^{*}\left(x^{*}\right)=u\left(\mathrm{~T} x^{*}\right) \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{D}^{*}\right)$ and $\left.\left.\mid u^{*}\right\rceil_{\alpha, \mathrm{D}^{*}} \leqslant c \mathrm{M}^{\alpha+3 n / 2} \mid u\right\rceil_{\alpha, \mathrm{D}}$ where $c$ depends only on $n$ and $\alpha^{*}$.

Proof. - By Prop. 3), § 9, II, $u^{*} \in \mathrm{P}_{\mathrm{loc}}^{\alpha}\left(\mathrm{D}^{*}\right)$.
Let $y_{l}\left(x^{*}\right), l=1, \ldots, n$, be the coordinate functions of T .

Then for $|i| \leqslant m$ and almost all $x^{*} \in \mathrm{D}^{*}$,
$\mathrm{D}_{i} u^{*}\left(x^{*}\right)=\mathrm{D}_{i}\left(u\left(\mathrm{~T} x^{*}\right)\right)$
where the summation is taken over all $t=\left(t_{1}, \ldots, t_{|t|}\right)$, $\underset{\left|s^{(m)}\right|}{\leqslant}|t| \leqslant|i|, \quad 1 \leqslant t_{m} \leqslant n$, and $s^{(m)}$ such that $\bigcup_{m} s^{(m)}=i$, $\left|s^{(m)}\right| \geqslant 1$ (cf. (2.6)). We define

$$
\varphi\left(x^{*}\right) \equiv \varphi\left(x^{*} ; s^{(1)}, \ldots, s^{(1)}, t\right)=\frac{1}{|t|!} \prod_{m=1}^{|t|} \mathrm{D}_{s(m)} y_{t_{m}}\left(x^{*}\right)
$$

and it is easy to see that $\varphi$ is a multiplier on $\mathrm{D}^{*}$ with Lipschitz constant $\mathrm{M}^{[i \mid} \mid(|t|-1)$ ! and of at least order -1 when $\alpha$ is an integer and at least order 0 when $\alpha$ is not an integer. Hence by Prop. 6), the fact that T is Lipschitzian and the classical theorems on the transformation of integrals, we obtain

$$
\begin{aligned}
\mid \mathrm{D}_{i} u^{*} 7_{\beta, \mathrm{D}} & \leqslant \Sigma\left|\varphi\left(x^{*}\right) \mathrm{D}_{t} u\left(\mathrm{~T} x^{*}\right)\right\rangle_{\beta, \mathrm{D}} \leqslant c \mathrm{M}^{[i]} \Sigma \mid \mathrm{D}_{t} u\left(\mathrm{~T} x^{*}\right) 7_{\beta, \mathrm{D}} \\
& \left.\leqslant c \mathrm{M}^{i \mid+3 n / 2+\beta} \Sigma \mid \mathrm{D}_{t} u\right\rceil_{\beta, \mathrm{D}},
\end{aligned}
$$

and the proposition follows by (2.3b) (if $\beta=0$ the exponent of M may be reduced to $\alpha+\frac{n}{2}$ ).

Theorem I. - $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ is a complete functional space relative to the exceptional class $\mathfrak{Q}_{2 \alpha}(\mathrm{D})$ of subsets of D of $2 \alpha$-capacity 0 . It is the perfect functional completion of its subspace of infinitely differentiable functions.

Proof. - Let $\left\{\mathrm{U}_{k}\right\}$ be a locally finite covering of D by open relatively compact subsets of $D$, and let $\left\{\varphi_{k}\right\}$ be a corresponding partition of unity of class $\mathrm{C}^{\infty}$-that is: $\varphi_{k}$ is of class $\mathrm{C}^{\infty}$ and vanishes outside a compact subset of $\mathrm{U}_{k}$ :

$$
0 \leqslant \varphi_{k}(x) \leqslant 1 \text { for all } x \text {, and } \sum_{k=1}^{\infty} \varphi_{k}(x)=1 \text { for all } x \in \mathrm{D}
$$

If $\left\{u_{n}\right\}$ is a Cauchy sequence in ${ }_{\mathrm{P}}{ }^{\alpha}(\mathrm{D})$, then by Prop. 7) $\left\{\varphi_{1} u_{n}\right\}$ is a Cauchy sequence in $\mathrm{P}^{\alpha}$. Therefore $\left\{\varphi_{1} u_{n}\right\}$ contains a subsequence $\left\{\varphi_{1} u_{1, n}\right\}$ which converges pointwise except on a subset of $2 \alpha$-capacity 0 . Similarly, $\left\{\varphi_{2} u_{1, n}\right\}$ contains a subsequence $\left\{\varphi_{2} u_{2, n}\right\}$ which converges pointwise except
on a set of $2 \alpha$-capacity 0 . If we continue to extract subsequences and then take the diagonal sequence, we get a subsequence $\left\{\varphi_{n}\right\}$ of $\left\{u_{n}\right\}$ such that for each $k,\left\{\varphi_{k} \varphi_{n}\right\}$ converges pointwise except on a subset of $D$ of $2 \alpha$-capacity 0 . This proves the functional space property. If $\varphi$ is the pointwise limit of $\left\{\varphi_{n}\right\}$, then, since $\left\{\varphi_{k} \varphi_{n}\right\}$ is Cauchy in $\mathrm{P}^{\alpha}$ and converges pointwise to $\varphi_{k}{ }^{\rho}$ except on a set of $2 \alpha$-capacity 0 , it follows that $\varphi_{k} \nu \in \mathrm{P}^{\alpha}$; hence that $\varphi \in \mathrm{P}_{\text {ioc }}^{\alpha}(\mathrm{D})$. By picking a further subsequence if necessary, it can be assumed that for $|i| \leqslant \alpha, \mathrm{D}_{\mathrm{i}} \boldsymbol{\nu}_{n}$ converges pointwise except on a set of $(2 \alpha-2|i|)$-capacity 0 . Then Fatou's lemma shows that

$$
|\varphi|_{\alpha, \mathrm{D}} \leqslant \liminf _{n>\infty}\left|\varphi_{n}\right|_{\alpha, \mathrm{D}}, \quad\left|\varphi-\varphi_{m}\right|_{\alpha, \mathrm{D}} \leqslant \liminf _{n>\infty}\left|\varphi_{n}-\varphi_{m}\right|_{\alpha, \mathrm{D}}
$$

from which it follows that $\varphi \in \check{\mathrm{P}}^{\alpha} \alpha(\mathrm{D})$ and that $\varphi_{n} \rightarrow \varphi$ in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$. This gives the completeness.

The argument to show that there cannot be a functional completion of the subspace of infinitely differentiable functions relative to a smaller exceptional class than the class $\mathfrak{A}_{2 \alpha}(\mathrm{D})$ is familiar by now and will be omitted. What remains is to show that the infinitely differentiable functions are dense.

If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$, then since $\varphi_{k} u \in \mathrm{P}^{\alpha}$ and vanishes outside a compact subset of $\mathrm{U}_{k}$, there exists $w_{k} \in \mathrm{C}_{0}^{\infty}\left(\mathrm{U}_{k}\right)$ such that

$$
\begin{equation*}
\left|\varphi_{k} u-\varphi_{k}\right|_{\alpha, \mathrm{R}^{n}}<\frac{\varepsilon}{2^{k}} . \tag{2.9}
\end{equation*}
$$

Since the covering $\left\{\mathrm{U}_{k}\right\}$ is locally finite, the sum

$$
\rightsquigarrow(x)=\sum_{k=1}^{\infty} \oiint_{k}(x)
$$

is finite on a neighborhood of each point of D . Therefore $s$ is of class $\mathrm{C}^{\infty}$ on D . From (2.9) and the completeness of ${ }^{\alpha}{ }^{\alpha}(\mathrm{D})$ it follows that $u-\varphi=\Sigma\left(\varphi_{k} u-\varphi_{k}\right) \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})-$ hence that $\propto \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ - and that $|u-\propto|_{\alpha, \mathrm{D}}<\varepsilon$.
9) Let $\mathscr{B}_{\mathrm{D}}$ be the set of functions spith bounded support in D (i.e. $f \in \mathscr{B}_{\mathrm{D}}$ if $f$ sanishes outside $[|x|<\mathrm{R}] \cap \mathrm{D}$ for some R ). Then $\check{\mathrm{P}}^{\alpha}(\mathrm{D}) \cap \mathfrak{B}_{\mathrm{D}} \cap \mathrm{C}^{\infty}(\mathrm{D})$ is dense in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$.

Proof. - Let $\varphi \in \mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$ and $=1$ on a neighborhood of 0 and $u \in \check{P}^{\alpha}(\mathrm{D}) \cap \mathrm{C}^{\infty}(\mathrm{D})$. Then the functions $u_{(\rho)}(x)=\varphi(\rho x) u(x)$ are bounded in norm in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$. So, by a well known theorem from Hilbert space theory, there is a sequence $\rho_{k} \downarrow 0$ such that the arithmetic means of the sequence $\left\{u_{\left(\rho_{k}\right)}\right\}$ converge strongly in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$. These arithmetic means must converge to $u$ since they converge pointwise to $u(x)$. But the arithmetic means have bounded support since each $u_{\left(\rho_{k}\right)}$ has bounded support and are in $\mathrm{C}^{\infty}(\mathrm{D})$. Hence the proposition follows by Theorem I.
10) Let $\varphi$ be a multiplier of order $\alpha^{*}$ on $\mathrm{R}^{n}$ and $=1$ in a neighborhood of 0 and for $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ put $\mathrm{T}_{\mathrm{\rho}} u(x)=\varphi(\rho x) u(x)$. Then $\mathrm{T}_{\rho} u \rightarrow u$ in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ as $\rho \downarrow 0$.

Proof. - By Prop. 6) $\left\{\mathrm{T}_{\rho}\right\}$ is a uniformly bounded family of linear transformations of $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ into $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$. If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and has bounded support the proposition is trivial, but since such functions are dense in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ by Prop. 9), the proof is complete.

Remarks about the spaces ${ }^{\text {Pr }}{ }^{\alpha, p}(\mathrm{D}), 1<p<\infty$. The spaces Р̌ ${ }^{\alpha, p}$ were introduced in [2]. These spaces reduce to $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ when $p=2$. The definition of the norms in these spaces lends itself to a suitable definition of norm in an open set $\mathrm{D} \subset \mathrm{R}^{n}$. This allows us to define the spaces ${ }^{\text {P }}{ }^{\alpha, p}(\mathrm{D})$. We introduce two norms, the standard and approximate norm which will be denoted by $|u|_{\alpha, p, \mathbf{D}}$ and $\left.\mid u\right\rceil_{\alpha, p, \mathbf{D}}$ respectively. However, for $p=2$, $|u|_{\alpha, 2, \mathrm{D}}=|u|_{\alpha, 2, \mathrm{D}}=|u|_{\alpha, \mathrm{D}}$ for all $\alpha$ and D. Therefore to have a norm analogous to the approximate norm which was introduced in this section for $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ we will introduce the second approximate norm $\mid u]_{\alpha, p, \mathrm{D}}$.

We shall define these norms formally after we introduce the following notation. Let $\mathrm{A}^{(1)}\left(\rho_{1}, \ldots, \varphi_{l}\right)$ be an $l$-linear complex valued functional on $\frac{\mathrm{R}^{n} \times \ldots \times \mathrm{R}^{n}}{l \text {-times }}$ with $\phi_{j} \in \mathrm{R}^{n}$ (i.e. $\mathrm{A}^{(l)}=\mathrm{A}_{r e}^{(l)}+i \mathrm{~A}_{i m}^{(l)}$ where $\mathrm{A}_{r e}^{(l)}$ and $\mathrm{A}_{i m}^{(l)}$ are $l$-covariant tensors). We note that in terms of any orthonormal basis of $\mathrm{R}^{n}$ we may write $\mathrm{A}^{(l)}\left(\rho_{1}, \ldots, \varphi_{l}\right)=\sum_{|i|=l} \mathrm{~A}_{i}^{(l)} \varphi_{1}^{i_{1}} \ldots \varphi_{l}^{i_{l}}$ where
$\varphi_{k}=\left(\varphi_{k}^{1}, \ldots, \varphi_{k}^{n}\right)$. Note that the $A_{i}^{(l)}$ depend on the choice of the basis. Let

$$
\Sigma^{(l)}=\frac{\partial S(0,1) \times \cdots \times \partial S(0,1), \theta_{(l)}=\left(\theta_{1}, \ldots, \theta_{l}\right) \in \Sigma^{(l)} \text {-times }}{}
$$

and $d \theta_{(l)}$ be the element of volume in $\Sigma^{(l)}$. Then we define $\left|\mathrm{A}^{(l)}\right|_{p}^{p}=\left(\frac{n}{\omega_{n}}\right)^{l} \int_{\Sigma^{(l)}}\left|\mathrm{A}^{(l)}\left(\theta_{(l)}\right)\right|^{p} d \theta_{l} \quad$ and $\quad\left|\mathrm{A}^{(l)}\right\rangle_{p}^{p}=\sum_{|i|=l}\left|\mathrm{~A}_{i}^{(l)}\right|^{p}$. $\left|\mathrm{A}^{(l)}\right|_{p}$ is independent of the basis chosen in $\mathrm{R}^{n}$ whereas $\left.\mid \mathrm{A}^{(l)}\right]_{p}$ depends on the basis except for $p=2$ when $\left|\mathrm{A}^{(l)}\right|_{2}=\left|\mathrm{A}^{(l)}\right\rangle_{2}$. For $p \neq 2$, one shows that

$$
\left.n^{-l / \min \left(2, p^{\prime}\right)} \mid \mathrm{A}^{(l)}\right]_{p} \leqslant\left|\mathrm{~A}^{(l)}\right|_{p} \leqslant n^{l / \min (2, p)}\left|\mathrm{A}^{(l)}\right\rangle_{p}
$$

where $\frac{1}{p^{\prime}}+\frac{1}{p}=1$.
Let $m=[\alpha], \beta=\alpha-m$ and for $\beta>0$ let

$$
d \mu_{\beta}(x, y)=\frac{\mathrm{G}_{2 n+2 \beta}(x-y)|x-y|^{-n}}{\mathrm{C}(n, \beta) \mathrm{G}_{2 n+2 \beta}(0)} d x d y
$$

With the above we define formally for $\beta>0$,

$$
\begin{aligned}
|u|_{\alpha, p, \mathbf{D}}^{p} & =\sum_{l=0}^{m}\binom{m}{l}\left(\frac{2}{p}\right)^{l} \\
& \times\left[\int_{\mathbf{D}}\left|\nabla^{\iota} u(x)\right|_{p}^{p} d x+\int_{\mathbf{D}} \int_{\mathbf{D}}\left|\frac{\nabla^{\imath} u(x)-\nabla^{l} u(y)}{|x-y|^{\beta}}\right|_{p}^{p} d \mu_{\beta}(x, y)\right]
\end{aligned}
$$

where $\nabla^{l} u(x)$ is the $l$-th gradient of $u(x)$, i.e. the tensor $\mathrm{D}_{i} u(x)$ with $|i|=l$. If $\beta=0$, i.e. $m=\alpha$, then

$$
|u|_{m, p, \mathbf{D}}^{p}=\sum_{l=0}^{m}\binom{m}{l}\left(\frac{2}{p}\right)^{l} \int_{\mathbf{D}}\left|\nabla^{l} u(x)\right|_{p}^{p} d x
$$

Similarly,

$$
\begin{aligned}
\mid u \uparrow_{\alpha, p, \mathbf{D}}^{p} & =\sum_{l=\mathbf{0}}^{m}\binom{l}{m}\left(\frac{2}{p}\right)^{l} \times \\
& {\left.\left[\int_{\mathbf{D}} \mid \nabla^{l} u(x)\right\rceil_{p}^{p} d x+\int_{\mathbf{D}} \int_{\mathbf{D}}\left|\frac{\nabla^{l} u(x)-\nabla^{\prime} u(y)}{|x-y|^{\beta}}\right|_{p}^{p} d \mu_{\beta}(x, y)\right] }
\end{aligned}
$$

and if $\beta=0$ we omit the double integral as in $|u|_{\alpha, p, \mathrm{D}}$. To define the second approximate norm we merely replace
$d \mu_{\beta}(x, y) \quad$ by $\frac{d x d y}{\mathrm{C}(n, \beta)|x-y|^{n}}$ in $|u\rangle_{\alpha, p, \mathbf{D}}^{p}$.
It is clear from what has been mentioned above that

$$
\left.\left.n^{-m / \min \left(2, p^{\prime}\right)} \mid u\right\rceil_{\alpha, p, \mathbf{D}} \leqslant|u|_{\alpha, p, \mathbf{D}} \leqslant \mathrm{n}^{m / \min (2, p)} \mid u\right\rceil_{\alpha, p, \mathbf{v}} .
$$

The spaces ${ }^{\check{\alpha}}{ }^{\alpha, p}\left(\mathrm{R}^{n}\right)$ are well determined as the perfect functional completion of $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$ with respect to the norm $|u|_{\alpha, p, \mathrm{R}^{n}}$. This was proved in [2]. The more familiar spaces $\mathrm{W}_{p}^{\alpha}$ (introduced in [7] and [12]) were also considered in [2] and were defined as imperfect functional completions of $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$ with the norm $|u|_{\alpha, p, \mathbb{R}^{n}}$ relative to the class of sets with Lebesgue measure 0 .

Having ${ }^{\alpha}, p\left(\mathrm{R}^{n}\right)$ defined, by the usual localization we obtain the definition of ${\underset{\mathrm{P}}{\mathrm{loc}}}_{\alpha, p}^{(D)}(\mathrm{D})$ (and also $\mathrm{W}_{p, 100}^{\alpha}(\mathrm{D})$ ). By the results of [2], therefore, for $u \in \mathrm{P}_{\mathrm{loc}}^{\alpha, p}(\mathrm{D})$ (or $\in \mathrm{W}_{p, \mathrm{oc}}^{\alpha}(\mathrm{D})$ ) all derivatives (or distribution derivatives) $\mathrm{D}_{i} u,|i| \leqslant \alpha$, will be functions in $L_{\text {ioc }}^{p_{0}}(D)$. Hence for these functions it is meaningful to consider $|u|_{\alpha, p, \mathbf{D}},|u\rangle_{\alpha, p, \mathbf{D}}$ and $\left.\mid u\right]_{\alpha, p, \mathbf{D}}$. The space $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D})$ (or $\left.\mathrm{W}_{p}^{\alpha}(\mathrm{D})\right)$ is defined as the subspace of $\check{\mathrm{P}}_{\text {loc }}^{\alpha, p}(\mathrm{D})$ (or $\mathrm{W}_{p, \text { loc }}^{\alpha}(\mathrm{D})$ ) on which $|u|_{\alpha, p, \mathbf{D}}<\infty$.

Essentially all the results of the present paper concerning ${ }_{\mathrm{P}}{ }^{\alpha}(\mathrm{D})$ have exact analogues for $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D})$. In particular, Theorem $\mathrm{I}, \S 0$, is valid for $\check{\mathrm{P}}^{\alpha, p}\left(\mathrm{R}^{n}\right)$ (or $\check{\mathrm{P}}_{\mathrm{occ}}^{\alpha, p}(\mathrm{D})$ ) so that if $u \in \mathrm{~W}_{p}^{\alpha}(\mathrm{D})$ then the correction of $u$ is in $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D})$ (cf. [2]).

To obtain the analogues to the results of § 1, we remark that ${ }_{\mathrm{P}} \alpha, \mathrm{p}\left(\mathrm{R}^{n}\right)$ corresponds to $\mathrm{P}^{\alpha}=\check{\mathrm{P}}^{\alpha}\left(\mathrm{R}^{n}\right)$ and hence the analogue to $\mathrm{P}^{\alpha}(\mathrm{D})$ is the class of restrictions to D of functions in $\stackrel{\mathrm{P}^{\alpha, p}\left(\mathrm{R}^{n}\right)}{ }$ with the norm $\|u\|_{\alpha, p, \mathrm{D}}=\inf |\tilde{u}|_{\alpha, p, \mathrm{R}^{n}}$ for all $\tilde{u} \in \check{\mathrm{P}}^{\alpha, p}\left(\mathrm{R}^{n}\right)$ with $\tilde{u}(x)=u(x)$ in D .

All the propositions in $\S 1$ are either valid verbatim or have obvious analogues for $p \neq 2$ except for those pertaining to restrictions to hyperplanes (Props. 6) and 7)). These are still essentially valid if $\alpha-\frac{n-k}{2}$ is replaced by $\alpha-\frac{n-k}{p}$ and this number is not an integer.

The propositions and theorem of the present section are all valid, with a suitable change in constant, when $|u|_{\alpha, \mathrm{D}}$ is replaced by $\mid u\rceil_{\alpha, p, \mathbf{D}}$ and $\left.\mid u\right\rceil_{\alpha, \mathbf{D}}$ is replaced by $\left.\mid u\right]_{\alpha, p, \mathbf{D}}$ (and ${ }_{\mathrm{P}}^{\alpha}(\mathrm{D})$ by $\left.\check{\mathrm{P}}^{\alpha, p}(\mathrm{D})\right)$. However, some of the proofs have to be changed especially when we use Fourier transforms (these cannot be used for $p \neq 2$ ).

The spaces ${ }^{\alpha}{ }^{\alpha, p}\left(\mathrm{R}^{n}\right)$ for $p=1$ or $\infty$ were introduced in [2]; however this theory is complicated even on $\mathrm{R}^{n}$, in particular, when $p=1$ and $\alpha$ is an integer $>1$. It has not been proved as yet that there exists a perfect functional completion of $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$ in the last mentioned cases. They have many other exceptional features - for instance, they are not reflexive. We can introduce for $p=1$ or $p=\infty$ the corresponding classes $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D})$. If we consider the results of the present paper and attempt to extend them to similar results for these classes it turns out that there are many which can be extended, but also several which cannot be extended.

To avoid undue length in the present paper we shall restrict our remarks in the following sections to $1<p<\infty$ (unless otherwise stated).

## 3. Inessential singularities of functions in $\check{\mathbf{P}}^{\alpha}(\mathbf{D})$ and Lichtenstein extensions.

In this section we give some results on the possibility of extending a function in $\check{P}^{\alpha}(D)$ to a larger open set $D_{1}$. These results will be used later in this section when we introduce the Lichtenstein extension.

Theorem I. - Let D and $\mathrm{D}_{1}$ be open sets such that $\mathrm{D} \subset \mathrm{D}_{1}$ and $\left|\mathrm{D}_{1}-\mathrm{D}\right|=0$ and let $m=[\alpha]$. The function $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ has an extension in $\check{\mathrm{P}}^{\alpha}\left(\mathrm{D}_{1}\right)$ if and only if for every $k=1, \ldots, n$, and for almost every line $l$ parallel to the $x_{k}$-axis, each derivative $\frac{\partial^{j} u}{\partial x_{k}^{j}} j \leqslant m-1$, has an absolutely continuous extension to $l \cap \mathrm{D}_{1}$. If this condition is satisfied, the extension is unique.

Remark 1. - It is assumed that the condition is satisfied for each $k$. However, it is not assumed that there is any rela-
tion between the extensions in different directions. That there is such a relation results from the proof.

Proof. - The necessity of the condition is obvious from the results of Chapter II, specifically Theorem 1, § 7, localized.

The proof of the sufficiency relies on Prop. 2'), § 9, chap. II. This proposition shows that on $\mathrm{D}_{1}, u$ is equal a.e. to a function in $\mathrm{P}_{\text {ioc }}^{\alpha}\left(\mathrm{D}_{1}\right)$. Obviously we may assume that $u$ is a corrected function in $D$ (relative, say, to spherical means). Since $u \in L^{2}\left(D_{1}\right)$ we can introduce the corrected function $u_{1}$ of $u$ in $D_{1}$ which is an extension of $u$ and which is in $\mathrm{P}_{\mathrm{ioc}}^{\alpha}\left(\mathrm{D}_{1}\right)$ (see Theorem I, § 0). Clearly $\left|u_{1}\right|_{\alpha, \mathbf{D}_{4}}=|u|_{\alpha, \mathrm{D}}<\infty$, hence

$$
u_{1} \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{D}_{1}\right) .
$$

The uniqueness of $u_{1}$ (up to sets of $2 \alpha$-capacity 0 ) comes immediately from the Frostman mean value theorem (Prop. 1, § 4), Chap. II).

If it happens that $\mathrm{D}_{1}-\mathrm{D}$ has $(n-1)$-dimensional measure 0 , then for almost all lines $l$ in any given direction, $\mathrm{D}_{1} \cap l=\mathrm{D} \cap l$. Hence we have the following corollary.

Theorem I'. - If $\mathrm{D}_{1}$ - D has $(n-1)$-dimensional measure 0 , then every function $u \in \mathrm{P}^{\alpha}(\mathrm{D})$ has a unique extension $u_{1} \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{D}_{1}\right)$.

Let $h_{\mu}, \mu=0,1, \ldots, q$ be a strictly increasing sequence of positive numbers and consider the $q+1$ linear equations for $a_{\mu}$,

$$
\begin{equation*}
\sum_{\mu=0}^{q} a_{\mu}\left(-h_{\mu}\right)^{p}=1, \quad p=0,1, \ldots, q . \tag{3.1}
\end{equation*}
$$

It is easy to see that

$$
\begin{equation*}
a_{\mu}=\prod_{\substack{j=0 \\ j \neq \mu}}^{q} \frac{h_{j}+1}{h_{j}-h_{\mu}} \tag{3.2}
\end{equation*}
$$

Let D be an open set in $\mathrm{R}^{n}$ such that

$$
\mathrm{D} \subset\left[x_{n}<0\right], \quad \mathrm{D}_{+}=\bigcap_{\mu=0}^{q}\left[\left(x^{\prime}, x_{n}\right):\left(x^{\prime},-h_{\mu} x_{n}\right) \in \mathrm{D}\right]
$$

and $\tilde{D}=\left(\mathrm{D} \cup \mathrm{D}_{+} \cup\left[x_{n}=0\right]\right)^{\circ}$. Let $\mathfrak{m}(\mathrm{D})$ be the class of functions which are measurable and finite a.e. on $D$. Then
for $u \in \mathfrak{M r}(\mathrm{D})$ we define the Lichtenstein extension of order $q$ (relative to $\left\{h_{\mu}\right\}$ ) of $u$ by

$$
\begin{array}{cl}
\tilde{u}(x)=u(x) \quad \text { for } & x \in \mathrm{D}, \\
\tilde{u}(x)=\sum_{y=0}^{q} a_{\mu} u\left(x^{\prime},-h_{\mu} x_{n}\right) & \text { for } \quad x \in \mathrm{D}_{+}, \tag{3.3b}
\end{array}
$$

whenever all terms in the sum are defined and finite.
(3.3c) $\tilde{u}(x)=$ the correction of $\tilde{u}$ as defined above for $x \in \tilde{\mathrm{D}} \cap\left[x_{n}=0\right]$ if it exists, otherwise not defined $\left.{ }^{(14}\right)$.
The restriction of $\tilde{u}$ to $\mathrm{D}_{+}$, as defined by (3.3b), is the reflected function and the operation leading from $u$ in D to the reflected function is called Lichtenstein reflection of order $q$ (rel. to $\left.\left\{h_{\mu}\right\}\right)$.

Remark 2. - If $u \in \mathrm{C}^{p}(\overline{\mathrm{D}}), p \leqslant q$, then it is easy to see that $\tilde{u} \in \mathbb{C}^{p}(\tilde{\mathrm{D}})$ (cf. (3.4) below) and $u$ may be determined on

$$
\tilde{\mathrm{D}} \cap\left[x_{n}=0\right]
$$

by continuity instead of $(3.3 c)$. The first idea of such an extension was due to L. Lichtenstein [9] who introduced it for $q=1$ and who did it not only for hyperplanes but also for hypersurfaces of class $\mathrm{C}^{1}$. The idea of Lichtenstein was applied by M. R. Hestenes [8] to define the extension of order $q$ across hypersurfaces of class $\mathrm{C}^{q}$. Quite recently this idea was further extended by R. T. Seeley [11] to define an extension of order $\infty$ across hyperplanes. We will use Seeley's idea in $\S 11$ to define an extension of order $\infty$ across any hypersurface which is the graph of a Lipschitzian function.

1) If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D}), \alpha^{*} \leqslant q$, then $\tilde{u}-$ the Licthenstein extension of order $q$ of $u$ - belongs to $\check{\mathrm{P}}^{\alpha}(\tilde{\mathrm{D}})$ and $\left.\left.\mid \tilde{u}\right\rceil_{\alpha, \tilde{\mathrm{D}}} \leqslant c \mid u\right\rceil_{\alpha, \mathrm{D}}$ where $c$ depends only on $n$ and $q$ (and the choice of $h_{\mu}$ ).

Proof. - Clearly $\tilde{u} \in \mathrm{P}_{\text {toc }}^{\alpha}\left(\mathrm{D} \cup \mathrm{D}_{+}\right)$. We shall show in part $\left.a\right)$, below, that the inequality is valid when $\tilde{\mathrm{D}}$ is replaced by $\mathrm{D} \cup \mathrm{D}_{+}$. In part $b$ ), we shall show that $\tilde{u}$ as defined in (3.3a) and (3.3b) (i.e $\tilde{u}$ is restricted to $\mathrm{D} \cup \mathrm{D}_{+}$) satisfies the hypotheses of Theorem I with respect to $\mathrm{D} \cup \mathrm{D}_{+}$and $\tilde{\mathrm{D}}$ which implies
${ }^{(14)}$ If $\tilde{u}$ is not integrable in a neighborhood of $x$ the correction does not exist at $x$.
that this restriction of $\tilde{u}$ has an extension $\tilde{u}_{1} \in \tilde{\mathrm{P}}^{\alpha}(\tilde{\mathrm{D}})$. By Theorem I, § 0 , we have $\tilde{u}=\tilde{u}_{1}$ exc. $\mathfrak{\vartheta}_{2 \alpha}$ on $\tilde{\mathrm{D}}$ which will complete the proof of the proposition.
a) Suppose $i,|i| \leqslant \alpha^{*}+1$, contains $k$ indices $n$. Then for $x \in \mathrm{D}_{+}$

$$
\begin{equation*}
\mathrm{D}_{i} \tilde{u}(x)=\sum_{\mu=0}^{q} a_{\mu}\left(-h_{\mu}\right)^{k}\left(\mathrm{D}_{i} u\right)\left(x^{\prime},-h_{\mu} x_{n}\right)\left({ }^{15}\right) . \tag{3.4}
\end{equation*}
$$

Therefore for $|i| \leqslant \alpha^{*}+1$,

$$
\begin{aligned}
\left|\mathrm{D}_{i} u\right\rangle_{0, \mathbf{v}_{+}} & \leqslant \sum_{\mu=0}^{q}\left|a_{\mu}\right| h_{\mu}^{k}\left|\left(\mathrm{D}_{i} u\right)\left(x^{\prime},-h_{\mu} x_{n}\right)\right\rangle_{0, \mathbf{D}_{+}} \\
& \leqslant\left(\sum_{\mu=0}^{q}\left|a_{\mu} h_{\mu}^{k-1 / 2}\right|\right)\left|\mathrm{D}_{i} u\right\rangle_{0, \mathbf{D}},
\end{aligned}
$$

which completes the proof of part $a$ ) if $\alpha$ is an integer.
Suppose $\beta=\alpha-m>0, m=[\alpha]$, then for $|i| \leqslant \alpha^{*}=m$

$$
\begin{align*}
& d_{\beta, \mathrm{DUD}_{+}}\left(\mathrm{D}_{i} u\right)=d_{\beta, \mathbf{D}}\left(\mathrm{D}_{i} u\right)+d_{\beta, \mathbf{D}_{+}}\left(\mathrm{D}_{i} u\right)  \tag{3.5}\\
& \quad+\frac{2}{\mathrm{C}(n, \beta)} \int_{\mathbf{D}} \int_{\mathbf{D}_{+}} \frac{\left|\mathrm{D}_{i} \tilde{u}(x)-\mathrm{D}_{i} u(y)\right|^{2}}{|x-y|^{n+2 \beta}} d x d y .
\end{align*}
$$

By using (3.4) in the last two terms of (3.5) and then applying the Cauchy-Schwarz inequality we have for a bound of the last two terms,

$$
\begin{aligned}
& \left(\sum_{\mu=0}^{q}\left|a_{\mu}\right|^{2} h^{2 k}\right) \\
& \times \sum_{\mu=0}^{q}\left(\frac{1}{\mathrm{C}(n, \beta)} \int_{\mathrm{D}_{+}} \int_{\mathrm{D}_{+}} \frac{\left|\left(\mathrm{D}_{i} u\right)\left(x^{\prime},-h_{\mu} x_{n}\right)-\left(\mathrm{D}_{i} u\right)\left(y^{\prime},-h_{\mu} y_{n}\right)\right|^{2}}{|x-y|^{n+2 \beta}} d x d y\right. \\
& \left.\quad+\frac{2}{\mathrm{C}(n, \beta)} \int_{\mathrm{D}} \int_{\mathbf{D}_{+}} \frac{\left|\left(\mathrm{D}_{i} u\right)\left(x^{\prime}, x_{n}\right)-\left(\mathrm{D}_{i} u\right)\left(y^{\prime},-h_{\mu} y_{n}\right)\right|^{2}}{|x-y|^{n+2 \beta}} d x d y\right) \\
& \quad \leqslant\left(\sum_{\mu=0}^{q}\left|a_{\mu}\right|^{2} h_{\mu}^{2 \mu}\right)\left(\sum_{\mu=0}^{q}\left(h_{\mu^{2}}+2 h_{\mu^{-1}}^{-1}\right)\left(\operatorname{Max}\left(h_{\mu}, 1\right)\right)^{n+2 \beta}\right) d_{\beta, \mathbf{D}}\left(\mathrm{D}_{i} u\right) .
\end{aligned}
$$

This completes the proof of part $a$ ).
b) If $l$ is a line parallel to the $x_{k}$-axis, $k=1, \ldots, n$, then by Theorem I, §7, II (localized) $\frac{\partial^{j} \tilde{u}}{\partial x_{k}^{j}}, j=0, \ldots, m-1$, is abso-

[^2]lutely continuous on $l \cap\left(\mathrm{D} \cup \mathrm{D}_{+}\right)$for almost all $l$. From this it is clear we need only consider lines parallel to the $x_{n}$-axis which satisfy $(i) l \cap \tilde{D} \cap\left[x_{n}=0\right] \neq 0$. For $j \leqslant m-1$ let $\rho\left(x^{\prime}, x_{n}\right)=\frac{\partial^{j} \tilde{u}}{\partial x_{n}^{j}}\left(x^{\prime}, x_{n}\right)$ and consider lines
$$
l_{x^{\prime}}=\left[\left(x^{\prime}, t\right):-\infty<t<\infty\right]
$$
which satisfy $(i)$ and in addition satisfy (ii) $\varphi\left(x^{\prime}, x_{n}\right)$ is absolu-
 is clear by (iii) that both the left and right hand limits as $t \rightarrow 0$ of $\varphi\left(x^{\prime}, t\right)$ exist and also, by (3.1) and (3.4), that these limits are equal. Hence by taking this limit as the value of $\varphi\left(x^{\prime}, 0\right)$ we make $\varphi$ absolutely continuous on $l_{x^{\prime}} \cap \tilde{\mathrm{D}}\left({ }^{(6)}\right)$. Since (ii) and (iii) are valid for almost all $l_{x^{\prime}}$ the hypotheses of Theorem I are satisfied, which completes the proof of the proposition.

Remark 3. - When we use the Lichtenstein extension for a function in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ we will assume that the order $q \geqslant \alpha^{*}$, so that $\tilde{u}$ will be in $\check{\mathrm{P}}^{\alpha}(\tilde{\mathrm{D}})$. It should be kept in mind that in general the Lichtenstein extension of order $q$ of a function will not belong to a class higher than $\check{\mathrm{P}}^{q+1}(\tilde{\mathbf{D}})$ no matter what class the initial function belongs to (a similar remark is valid for classes $\mathrm{C}^{p}(\overline{\mathrm{D}})$ ).

Remark 4. - Obviously we can consider the Lichtenstein extension with respect to any hyperplane; it is enough to change the coordinate axis suitably. As an example take the rectangle $\mathrm{D}=\left[c_{i}<x_{i}<d_{i} ; i=1, \ldots, n\right]$ ( $c_{i}$ or $d_{i}$ possibly infinite). We can consider the Lichtenstein extension of order $q$ with respect to the hyperplane $\left[x_{l}=c_{l}\right]$ then $\tilde{\mathrm{D}}=\left[c_{i}<x_{i}<d_{i}\right.$ for $i \neq l$ and $\left.c_{l}-h_{q}^{-1}\left(d_{l}-c_{l}\right)<x_{l}<d_{l}\right]$. A similar formula is valid for the extension across $\left[x_{l}=d_{l}\right]$.

We can also consider oblique Lichtenstein extensions which are extensions across an $(n-1)$-dimensional hyperplane $\pi$ in the direction of a unit vector $\theta$ which is not necessarily
${ }^{(16)}$ We use here the fact that if a function of one variable is absolutely continuous on - $b<t<0$ and on $0<t<b$ and is continuous on $-b<t<b$, and if its derivative is integrable on $-b<t<b$, then the function is absolutely continuous on - $b<t<b$.
orthogonal to $\pi$ (but not parallel). An application of Prop. 1) and Prop. 5), § 2 to the affine transformation which carries $\theta$ into the unit vector orthogonal to $\pi$ and which leaves $\pi$ invariant would suffice to give a result similar to Prop. 1) except that the constant $c$ would also depend on the angle between $\theta$ and $\pi$.
2) If $\mathrm{D}=\left[c_{i}<x_{i}<d_{i} ; i=1, \ldots, n\right]$ ( $c_{i}$ or $d_{i}$ possibly infinite) there is a linear mapping, $\tilde{u}=\mathrm{T}_{q} u$, of $\operatorname{mr}(\mathrm{D})$ into $\mathfrak{m}\left(\mathrm{R}^{n}\right)$ such that if $\alpha^{*} \leqslant q$ and $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ then $\tilde{u}=\mathrm{T}_{q} u \in \mathrm{P}^{\alpha}$ and $\left.\mid \tilde{u}]_{\alpha, \mathrm{R}^{n}} \leqslant \mathrm{CW}^{-\alpha^{*}-1} \mid u\right\rceil_{\alpha, \mathrm{D}}$ where $\mathrm{W}=\min \left(1, d_{i}-c_{i}\right)$ and C depends only on $q, n$ and $\left\{h_{\mu}\right\}$.

Proof. - Let

$$
\mathrm{D}_{l}=\left[c_{i}^{(l)}<x_{i}<d_{i}^{(l)} ; i=1, \ldots, n\right], \quad 0 \leqslant l \leqslant 2 n,
$$

where $c_{i}^{(l)}=c_{i}$ for $i>l$ and $c_{i}^{(l)}=c_{i}-h_{q}^{-1}\left(d_{i}-c_{i}\right)$ for $i \leqslant l ; d_{i}^{(l)}=d_{i}$ for $i>l-n$ and $d_{i}^{(l)}=d_{i}+h_{q}^{-1}\left(d_{i}+c_{i}^{(l)}\right)$ for $i \leqslant l-n$ and $h_{q}$ is the last term in the sequence $\left\{h_{\mu}\right\}$ which defines the Lichtenstein extension of order $q$.

We proceed by induction. Suppose $u \in \mathfrak{M r}(D)$, let $D_{0}=D$ and $\tilde{u}_{0}=u$. Trivially $\tilde{u}_{0} \in \operatorname{Mr}\left(\mathrm{D}_{0}\right)$. Suppose $\tilde{u}_{l} \in \operatorname{Mr}\left(\mathrm{D}_{l}\right)$, consider the Lichtenstein extension of order $q$ of $\tilde{u}_{l}$ across the hyperplane $\left[x_{l}=c_{l}\right]$ for $l \leqslant n$ and across $\left[x_{l-n}=d_{l-n}\right]$ for $l>n$ (cf. the example of Remark 4). It is easy to see that $\tilde{\mathrm{D}}_{l}=\mathrm{D}_{l+1}$ and from (3.3) that $\tilde{u}_{l+1} \in \operatorname{Mr}\left(\mathrm{D}_{l+1}\right)$. This completes the induction.

Hence $\tilde{u}_{2 n} \in \operatorname{MK}\left(\mathrm{D}_{2 n}\right)$ and $u \rightarrow \tilde{u}_{2 n}$ is a linear mapping. If $\mathrm{D}_{2 n}=\mathrm{R}^{n}$ the desired mapping is $\tilde{u}=\tilde{u}_{2 n}=\mathrm{T}_{q} u$. If $\mathrm{D}_{2 n} \neq \mathrm{R}^{n}$ then dist $\left(\partial \mathrm{D}_{2 n}, \mathrm{D}\right) \geqslant h_{q}^{-1} \mathrm{~W}$. Let $\xi^{( }(x)$ be the function given by Lemma $1, \S 1$, which vanishes outside $\mathrm{D}_{2 n}^{i}$ where

$$
\delta=\frac{1}{2} h_{q}^{-1} \mathrm{~W},
$$

and $=1$ on $\overline{\mathrm{D}}$. Then the desired mapping is $u=\varphi_{1} u_{2 n}=\mathrm{T}_{q} u$ (extended by 0 outside $\mathrm{D}_{2 n}$ ).

If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D}), \alpha^{*} \leqslant q$, then by Prop. 1) at each step of the induction

$$
\left.\tilde{u}_{l+1} \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{D}_{l+1}\right) \quad \text { and } \quad \mid \tilde{u}_{l+1}\right\rceil_{\alpha, \mathrm{D}_{l+1}} \leqslant c_{0}\left|\tilde{u}_{l} l_{\alpha, \mathbf{D}_{l}} \leqslant c_{0}^{c}\right| \tilde{u}_{\alpha, \mathrm{D}}
$$

where $c_{0}$ is the constant of Prop. 1) which depends only on $q, n$, and $\left\{h_{\mu}\right\}$. If $\mathrm{D}_{2_{n}}=\mathrm{R}^{n}$ this completes the proof; if

$$
\mathrm{D}_{2 n} \neq \mathrm{R}^{n},
$$

an application of Lemma 1, § 1 and Prop. 6), § 2 completes the proof.
$\left.2^{\prime}\right)$ If D is a rectangle then $\mathrm{P}^{\alpha}(\mathrm{D})=\mathrm{P}^{\alpha}(\mathrm{D})$.
Proof. - Proposition 2).
Remark 5. - We could use the oblique Lichtenstein extension to show that Props. 2) and $2^{\prime}$ ) are valid for a convex polyhedron ( ${ }^{17}$ ). However, a much more general result will be obtained later from a general theorem concerning Lipschitzian graph domains (Section 11).

Remarks about the spaces ${ }^{\text {P }}$ 人 $, p(\mathrm{D}), 1<p<\infty$. All the statements of the present section are true for the classes ${ }^{\text {P }}{ }^{\alpha, p}(\mathrm{D})$. In the proof of Theorem I we would refer to results and methods in [2] instead of Chapter II $\left({ }^{18}\right)$. All the other statements are obtained by proofs similar to those given in this section.

## 4. Behavior of $\left.\boldsymbol{d}_{\alpha, \mathrm{D}}(\boldsymbol{u}), \mid \boldsymbol{u}\right]_{\alpha, \mathrm{D}}$ and $|\boldsymbol{u}|_{\alpha, \mathrm{D}}$ for varying $\alpha$.

We will study $d_{\alpha, \mathbf{D}}(u),|u\rangle_{\alpha, \mathrm{D}}$ and $|u|_{\alpha, \mathrm{D}}$ for $\alpha$ varying between two consecutive integers $m \leqslant \alpha \leqslant m+1, m=0,1, \ldots$, especially when $\alpha \uparrow m+1$ or $\alpha \downarrow m$.

Throughout this section $u(x)$ will be assumed to be a corrected function in D (cf. §0). Hence, if $u \in \check{\mathrm{P}}^{m}(\mathrm{D}), m=[\alpha]$, and $|u|_{\alpha, \mathrm{D}}<\infty$, then $u \in \mathrm{P}^{\alpha}(\mathrm{D})$ by Prop. $\left.1^{\prime}\right)$, § 2.

For $\theta=\left(\theta_{1}, \ldots, \theta_{n}\right) \in \partial S=\partial S(0,1)$, denote by $E_{\theta}$ the orthogonal projection on the $(n-1)$-dimensional subspace orthogonal to $\theta$. For $x \in \mathrm{D}$ let $z^{\prime}=\mathrm{E}_{\theta}(x) \in \mathrm{E}_{\theta}(\mathrm{D})$ and

$$
\mathrm{I}\left(\theta, z^{\prime}\right)=\left[t: z^{\prime}+t \theta \in \mathrm{D}\right]
$$

$\left({ }^{17}\right)$ This was actually done in the first version of this paper.
$\left.{ }^{(18}\right)$ However, one result which was not given in [2] would have to be used, viz. that the local finiteness of the $L^{p}$-norms of the pure derivatives of order $k$ in each direction implies the local finiteness of the $L^{p}$-norms of all mixed derivatives of order $k$.

It is then easy to verify that for $f(x, y) \geqslant 0$ (and measurable on $\mathrm{D} \times \mathrm{D}$ )
(4.1) $\quad \int_{\mathrm{D}} \int_{\mathrm{D}} f(x, y) d x d y$
$=\frac{1}{2} \int_{\partial S} \int_{\mathbf{E}_{b}(\mathbf{D})} \int_{\mathbf{I}\left(\theta, z^{\prime}\right)} \int_{\mathbf{I}\left(\theta, z^{\prime}\right)} f\left(z^{\prime}+t \theta, z^{\prime}+s \theta\right)|s-t|^{n-1} d s d t d z^{\prime} d \theta$.
We now list some useful transformations of $d_{\alpha, \mathrm{D}}(u)$ :
(4.1a) $|u|_{0, \mathrm{D}}^{2}=\int_{\mathrm{D}}|u(x)|^{2} d x$

$$
=\frac{1}{\omega_{n}} \int_{\partial S} \int_{\mathrm{E}_{6}(\mathrm{D})}\left|u\left(z^{\prime}+s \theta\right)\right|_{0,1\left(\theta, z^{\prime}\right)}^{2} d z^{\prime} d \theta
$$

applying (4.1) to $d_{\alpha, \mathrm{D}}(u)$ for $0<\alpha<1$ we have

$$
\begin{equation*}
\left.d_{\alpha, \mathbf{D}}(u)=\frac{\mathrm{C}(1, \alpha)}{2 \mathrm{C}(n, \alpha)} \int_{\partial \mathrm{S}} \int_{\mathrm{F}_{\ell}(\mathrm{D})} d_{\alpha, 1\left(\theta, z^{\prime}\right)} u\left(z^{\prime}+s \theta\right)\right) d z^{\prime} d \theta \tag{4.1b}
\end{equation*}
$$

and by noting that

$$
\int_{\partial s} \theta_{i} \theta_{j} d \theta=\frac{\omega_{n}}{n} \delta_{i j} \quad \text { and } \quad \sum_{l=1}^{n} \theta_{l} \frac{\partial u}{\partial x_{l}}=\frac{d}{d s} u\left(z^{\prime}+s \theta\right)
$$

we have
(4.1c) $\quad d_{1, \mathrm{D}}(u)=\sum_{l=1}^{n}\left|\frac{\partial u}{\partial x_{l 0, \mathrm{D}}}\right|^{2}=\frac{n}{\omega_{n}} \int_{\mathrm{D}} \int_{\partial \mathrm{g}}\left|\sum_{l=1}^{n} \theta_{l} \frac{\partial u}{\partial x_{l}}\right|^{2} d \theta d x$

$$
=\frac{n}{\omega_{n}} \int_{\partial \mathrm{O}} \int_{\mathrm{F}_{\mathrm{K}}(\mathbf{D})} d_{1, \mathbf{1}\left(\theta, z^{\prime}\right)}\left(u\left(z^{\prime}+s \theta\right)\right) d z^{\prime} d \theta .
$$

For later reference, we note from the formulae for the Gamma function that

$$
\begin{equation*}
\frac{\mathrm{C}(1, \alpha)}{2 \mathrm{C}(n, \alpha)}=\frac{\Gamma(\alpha+n / 2)}{2 \pi^{\frac{n-1}{2}} \Gamma\left(\alpha+\frac{1}{2}\right)} \tag{4.2}
\end{equation*}
$$

is an increasing function of $\alpha, 0 \leqslant \alpha \leqslant 1$, which varies from $\frac{1}{\omega_{n}}$ to $\frac{n}{\omega_{n}}$.

Lemma 1. - Let $\mathrm{D} \subset \mathrm{R}^{n}$ be convex and $u \in \mathrm{P} v(\mathrm{D})$. Define

$$
\mathrm{I}(\alpha)=\left\{\begin{array}{l}
0 \text { for } \alpha=0, \\
\frac{1}{\mathrm{C}(n, \alpha)} \int_{\substack{\mathrm{D}}}^{\int_{|x-y|<1}} \frac{|u(x)-u(y)|^{2}}{|x-y|^{n+2 \alpha}} d x d y \text { for } 0<\alpha<1, \\
d_{1, \mathrm{D}}(u) \text { if } u \in \check{\mathrm{P}}^{1}(\mathrm{D}), \text { otherwise }=+\infty \text { for } \alpha=1 .
\end{array}\right.
$$

Then $\mathrm{I}(\alpha)$ is an increasing function of $\alpha$ which is continuous on any subintersal of $[0,1]$ where it is finite. Furthermore, $\lim _{\alpha \wedge 1} \mathrm{I}(\alpha)$ is finite if and only if $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$.

Remark 1. - It is clear by considering

$$
d_{\alpha, \mathrm{R}^{\mathrm{n}}}(u)=\int_{\mathrm{R}^{n}}|\xi|^{2 \alpha}|\hat{u}(\xi)|^{2} d \xi
$$

that in general $d_{\alpha, \mathrm{D}}(u)$ is not an increasing function.
Proof. - i) We consider first $0 \leqslant \alpha<1$. By (4.1) and (4.2) it is clear that we may restrict ourselves to considering

$$
\mathrm{D}=(a, b) \subset \mathrm{R}^{1}
$$

If $\mathrm{I}(\alpha) \equiv \infty$ for $0<\alpha<1, \mathrm{I}(\alpha)$ is obviously increasing. So we suppose $\mathrm{I}(\alpha)<\infty$ for some $\alpha$ and write

$$
\begin{align*}
\mathrm{I}(\alpha)=\frac{2}{\mathrm{C}(1, \alpha)} \int_{a<s-1<1}^{b} \int_{a}^{b} \frac{|u(s)-u(t)|^{2}}{|s-t|^{1+2 \alpha}} d s d t  \tag{4.3}\\
\quad=\frac{2}{\mathrm{C}(1, \alpha)} \int_{0}^{1} \frac{1}{r^{2 \alpha-1}} \varphi(r) d r
\end{align*}
$$

where $\varphi(r)=\int_{\mathbf{I}_{r}}\left|\frac{u(r+t)-u(t)}{r}\right|^{2} d t \leqslant \frac{4}{r^{2}}|u|_{0,(a, b)}^{2}$ and

$$
\mathrm{I}_{r}=(a, \max (a, b-r)) .
$$

By the Minkowski inequality we have

$$
\begin{aligned}
0 \leqslant \varphi(r)^{\frac{1}{2}} & \leqslant \frac{1}{2}\left[\int_{\mathbf{I}_{r}}\left|\frac{u(r+t)-u\left(\frac{r}{2}+t\right)}{r / 2}\right|^{2} d t\right]^{\frac{1}{2}} \\
& +\frac{1}{2}\left[\int_{\mathbf{I}_{r}}\left|\frac{u\left(\frac{r}{2}+t\right)-\left.u(t)\right|^{2}}{r / 2}\right|^{\frac{1}{2}} d t\right]^{\frac{1}{2}} \leqslant\left(\frac{r}{2}\right)^{\frac{1}{2}}<\infty .
\end{aligned}
$$

(This inequality was suggested by E. Gagliardo.) Therefore for fixed $r, \varphi\left(2^{-k} r\right)$ is an increasing function of $k$. Applying

Abel's summation formula ( ${ }^{(19}$ ) we have

$$
\begin{align*}
\mathrm{I}(\alpha)= & \frac{2}{\mathrm{C}(1, \alpha)} \sum_{k=0}^{\infty} \int_{2^{-k-1}}^{2^{2-k}} \frac{1}{r^{2 \alpha-1}} \varphi(r) d r  \tag{4.4}\\
= & \frac{2}{\mathrm{C}(1, \alpha)} \sum_{k=0}^{\infty} \int_{\frac{1}{2}}^{1} \frac{2^{k(\alpha-1)}}{r^{2 \alpha-1}} \varphi\left(2^{-k} r\right) d r \\
= & \frac{2}{\mathrm{C}(1, \alpha)\left(1-2^{2(\alpha-1)}\right)} \int_{\frac{1}{2}}^{1} \frac{1}{r^{2 \alpha-1}} \\
& \quad \times\left\{\varphi(r)+\sum_{k=1}^{\infty} 2^{2 k(\alpha-1)}\left(\varphi\left(2^{-k} r\right)-\varphi\left(2^{-k+1} r\right)\right)\right\} d r .
\end{align*}
$$

It is not difficult to show that $2 / \mathrm{C}(1, \alpha)\left(1-2^{2(\alpha-1)}\right)$ is an increasing function of $\alpha$ which converges to $1 / \log 2$ as $\alpha \uparrow 1$, and to 0 as $\alpha \downarrow 0$. Since the integrand in the last formula in (4.4) is a positive increasing function of $\alpha$ this completes the proof for $0 \leqslant \alpha<1$.
ii) We now show that $\lim _{\alpha \wedge 1} \mathrm{I}(\alpha)$ is finite if and only if $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$ and that $\mathrm{I}(\alpha)$ is continuous at $\alpha=1$.

We assume at first, as in $i$ ), that $\mathrm{D}=(a, b)$ and use (4.3). Suppose, in this case that $\lim \mathrm{I}(\alpha)<\infty$. Then from (4.4) we see that

$$
\lim _{\alpha \uparrow 1} \mathrm{I}(\alpha)=\frac{1}{\log 2} \int_{\frac{1}{2}}^{1} \frac{1}{r} \lim _{k \uparrow \infty} \varphi\left(2^{-k} r\right) d r<\infty
$$

and

$$
\lim _{k \uparrow \infty} \varphi\left(2^{-k} r\right)<\infty
$$

for almost every $r$. But this implies from a well-known Hilbert space theorem that for every such $r$ there is a subsequence $\left(u\left(2^{-k_{l}} \boldsymbol{r}+t\right)-u(t)\right) / 2^{-k_{l}} \boldsymbol{r}$ which converges weakly to

$$
\varphi(t) \in \mathrm{L}^{2}(a, b),
$$

$\left.{ }^{19}\right)$ If $b_{y} \geqslant 0$ is an increasing sequence and $a_{v} \geqslant 0$, then

$$
\sum_{v=0}^{\infty} a, b_{v}=s_{0} b_{0}+\sum_{v=1}^{\infty} s_{v}\left(b_{v}-b_{v-1}\right)
$$

where $s_{v}=\sum_{l=v}^{\infty} a_{l}$.
the distribution derivative of $u(t)$. Hence by Prop. 1), § 2, $u \in$ P $^{1}(a, b)$. By Prop. 2), §3. there exists $\tilde{\tilde{u}} \in \mathrm{P}^{\mathbf{1}}\left(\mathrm{R}^{1}\right)$ which is an extension of $u$. By using Fourier transforms and cominated convergence on proves immediately that

$$
r^{-1}[\tilde{u}(x+r)-\tilde{u}(x)]
$$

converges strongly to $\frac{\partial \tilde{u}}{\partial x}$ in $\mathrm{L}^{2}\left(\mathrm{R}^{\mathbf{1}}\right)$ for $r \bigvee 0$. Hence

$$
\begin{gathered}
\varphi(r)=\left|r^{-1}[u(x+r)-u(x)]\right|_{0, \mathrm{I}_{r}}^{2} \rightarrow\left|\frac{\partial u}{\partial x}\right|_{\mathrm{o}, \mathrm{D}}^{2} \quad \text { for } \quad r \backslash 0, \\
\lim _{\alpha \neq 1} \mathrm{I}(\alpha)=\frac{1}{\log 2} \int_{1 / 2}^{1} \frac{1}{r} \lim _{k \neq \infty} \varphi\left(2^{-k} r\right) d r=\left|\frac{\partial u}{\partial x_{0, \mathrm{D}}}\right|_{0}^{2} .
\end{gathered}
$$

which completes the proof in the special case $\mathrm{D}=(a, b)$.
Now if D is a convex set in $\mathrm{R}^{n}$ and $\lim _{\alpha, 1} \mathrm{I}(\alpha)<\infty$ this implies from the preceding and (4.1b) that ${ }^{\alpha, 1} d_{1,1\left(\theta, z^{\prime}\right)}\left(u\left(z^{\prime}+s \theta\right)\right)<\infty$ for almost all $\theta$ and $z^{\prime}$ in particular for at least $n$ linearly independent $\theta^{(m)}$. Hence from Prop. 1), § 2, $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$ and the rest of the proof follows.

1) If $\mathrm{D} \subset \mathrm{R}^{n}$ is convex, then a) for $\alpha \leqslant \gamma, \mathrm{P}^{\alpha}(\mathrm{D}) \supset \mathrm{P}^{\gamma}(\mathrm{D})$ and $|u|_{\alpha, \mathrm{D}} \leqslant \sqrt{10 n}|u|_{\gamma, \mathrm{D}}$ for $u \in$ $\left.^{\alpha}(\mathrm{D}), b\right)$ if

$$
u \in \check{P}^{\alpha}(\mathrm{D}), \quad 0 \leqslant \alpha<\alpha_{0}
$$

then $|u|_{\alpha, \mathrm{D}}$ is continuous for $0 \leqslant \alpha<\alpha_{0}$ and $\lim _{\alpha, \alpha}|u|_{\alpha, \mathrm{D}}$ always exists (possibly $=+\infty$ ). The limit is finite if and only if $u \in$ P $^{\alpha_{0}}(\mathrm{D})$ and in this case the limit is equal to $|u|_{\alpha_{0}, \mathrm{D}}$.

Proof of a). - By Prop. 3, § 1 (localized), it is sufficient to prove the inequality and from (2.1) it is clear that we may restrict ourselves to the case $0<\alpha \leqslant \gamma \leqslant 1$. By Lemma 1 and (2.7) we have that

$$
\begin{aligned}
|u\rangle_{\alpha, \mathrm{D}}^{2} & =\mid u\rceil_{0, \mathrm{D}}^{2}+d_{\alpha, \mathrm{D}}(u) \\
& \leqslant|u|_{0, \mathrm{D}}^{2}+\mathrm{I}(\alpha)+4 \int|u(x)|^{2}\left[\frac{1}{\mathrm{C}(n, \alpha)} \int_{\substack{|, \mathcal{D}|>1}} \frac{d y}{|x-y|^{n+2 \alpha}}\right] d x \\
& \leqslant \mathrm{I}(\gamma)+[4 n(1-\alpha)+1]|u|_{0, \mathrm{D}}^{2} \leqslant 5 n|u|_{\gamma, \mathrm{D}}^{2}
\end{aligned}
$$

and part $a$ ) follows by Prop. 3), § 2.
Proof of $b$ ). - Suppose part $b$ ) is true for $0 \leqslant \alpha_{0} \leqslant 1$. Let $m+1$ be an integer $\leqslant \alpha_{0}$. From (2.1) and our assumption
we have

$$
\begin{aligned}
\lim _{\alpha \uparrow m+1}|u|_{\alpha, \mathrm{D}}^{2} & =\sum_{k=0}^{m}\binom{m}{k} \sum_{|i|=k} \lim _{\beta \uparrow 1}\left|\mathrm{D}_{i} u\right|_{\beta, \mathrm{D}}^{2} \\
& =\sum_{k=0}^{m}\binom{m}{k} \sum_{|i|=k}\left(\left|\mathrm{D}_{i} u\right|_{0, \mathrm{D}}^{2}+\sum_{j=1}^{n}\left|\frac{\partial}{\partial x_{j}} \mathrm{D}_{i} u\right|_{0, \mathrm{D}}^{2}\right) \\
& =\sum_{k=0}^{m+1}\left(\binom{m}{k}+\binom{m}{k-1}\right) \sum_{|i|=k}\left|\mathrm{D}_{i} u\right|_{0, \mathrm{D}}^{2}=|u|_{m+1, \mathrm{D}}^{2}
\end{aligned}
$$

The rest of $b$ ) follows easily from our assumption so it is clear that we need only consider $0 \leqslant \alpha_{0} \leqslant 1$.

For $0<\alpha<1$, we have by $\S 4$, II that $\frac{\mathrm{G}_{2 n+2 \alpha}(x)}{\mathrm{G}_{2 n+2 \alpha}(0)}, x \neq 0$, is an analytic function of $\alpha$, which is majorated by 1 and by (1.3), II, that $\frac{1}{\mathrm{C}(n, \alpha)}$ is analytic which completes the proof in the case $0<\alpha<1$.

By (4.4), II we have for $0 \leqslant \alpha \leqslant 1$ and $0<|x| \leqslant 1$ that $1 \geqslant \frac{\mathrm{G}_{2 n+2 \alpha}(x)}{\mathrm{G}_{2 n+2 \alpha}(0)}>0$ and by (2.10), (3.6) and (4.2) of II
(4.5) If $|x| \geqslant 1$ and $\alpha \geqslant 0$ then $\frac{\mathrm{G}_{2 n+2 \alpha}(x)}{\mathrm{G}_{2, n+2 \alpha}(0)} \leqslant|x|^{\alpha+\frac{n}{2}-\frac{1}{2}} e^{1-|x|}$.

Hence, by Lemma 1 and (2.7) we have for $u \in \check{\mathrm{P}}^{\alpha_{0}}(\mathrm{D})$, $\alpha_{0}>0$, that
$0 \leqslant|u|_{\alpha, \mathbf{D}}^{2}-|u|_{0, \mathbf{D}}^{2}$

$$
\begin{aligned}
& \leqslant \mathrm{I}(\alpha)+\frac{4}{\mathrm{C}(n, \alpha)} \int_{\mathrm{D}}|u(x)|^{2} \int_{|x-y|>1}^{\sim} \frac{\mathrm{G}_{2 n+2 \alpha}(x-y)}{\mathrm{G}_{2 n+2 \alpha}(0)}|x-y|^{-n-2 \alpha} d y d x \\
& \leqslant \mathrm{I}(\alpha)+8 n \alpha(1-\alpha)|u|_{0, \mathrm{D}}^{2} e \Gamma\left(\frac{n}{2}+1\right) \downarrow 0 \text { as } \alpha \downarrow 0
\end{aligned}
$$

We now consider $\alpha \uparrow$ 1. By Remark 3, §2,

$$
\mid u\rceil_{\alpha, \mathbf{D}}^{2}-|u|_{\alpha, \mathbf{D}}^{2} \downarrow 0
$$

as $\alpha \uparrow 1$ for $u \in \check{\mathrm{P}}^{0}(\mathrm{D})$. By (2.7) it is clear that

$$
\left|\mathrm{I}(\alpha)-d_{\alpha, \mathrm{D}}(u)\right| \leqslant 4 n(1-\alpha)|u|_{0, \mathrm{D}}^{2}
$$

Hence by Lemma 1 , if $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D}), 0 \leqslant \alpha<1$, then $\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathbf{D}}^{2}$ exists and is finite if and only if $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$. Furthermore,
if $u \in \check{P}^{1}(\mathrm{D})$, then $\lim _{\alpha, \uparrow 1}|u|_{\alpha, \mathrm{D}}^{2}=|u|_{1, \mathrm{D}}^{2}$. This completes the proof of the proposition.

Remark 2. - Although $|u|_{\alpha, \mathrm{R}^{n}}^{2}=\int_{\mathrm{R}^{n}}\left(1+|\xi|^{2}\right)^{\alpha}|\hat{u}(\xi)|^{2} d \xi$ is an increasing function of $\alpha$, it is not known whether $|u|_{\alpha, \mathbf{D}}^{2}$, D convex, is increasing or not.

In the remaining part of this section we shall generally consider $0 \leqslant \alpha \leqslant 1$. The propositions and remarks have obvious analogues for $m \leqslant \alpha \leqslant m+1, m=1,2, \ldots$

Remark 3. - For a function $u \in \check{\mathrm{P}}^{0}(\mathrm{D})$ the behavior of $d_{\alpha, \mathrm{D}}(u)$ (or $|u|_{\alpha, \mathrm{D}}^{2}-|u|_{0, \mathrm{D}}^{2}$ ) inside the interval $0<\alpha<1$ is easily analyzed by decomposing

$$
d_{\alpha, \mathrm{D}}(u)=\frac{1}{\mathrm{C}(n, \alpha)}\left[\int_{|x-y|<1} \int_{\mathbf{D}}^{\bullet}+\int_{\mathbf{D}} \int_{|x-y|>1} \frac{|u(x)-u(y)|^{2}}{|x-y|^{n+2 \alpha}} d x d y\right]
$$

and noting that the second term is bounded by

$$
4 n(1-\alpha)|u|_{0, \mathrm{D}}^{2}
$$

The following cases are possible and exhaust all possibilities :
$1^{0} d_{\alpha, \mathbf{D}}(u) \equiv \infty$ for all $\alpha>0 ; 2^{\circ} d_{\alpha, \mathbf{D}}(u)$ is finite and continuous in $0<\alpha<\alpha_{0} \leqslant 1$ and infinite elsewhere, or $3^{\circ} d_{\alpha, \mathbf{D}}(u)$ is finite and continuous in $0<\alpha \leqslant \alpha_{0} \leqslant 1$ and infinite elsewhere.

We next give some properties of $|u|_{\alpha, \mathrm{D}}$ in an arbitrary domain $\mathrm{D} \subset \mathrm{R}^{n}$ as $\alpha \uparrow 1$. We remind the reader that by Remark $\left.3, \S 2,|u|_{\alpha, \mathbf{D}}^{2}-\mid u\right\rceil_{\alpha, \mathbf{D}}^{2} \downarrow 0$ as $\alpha \uparrow 1$; hence $|u|_{\alpha, \mathbf{D}}$ may be replaced in any of the propositions by $\mid u 1_{\alpha, \mathbf{D}}$.
2) If $u \in \check{\mathrm{P}}^{0}(\mathrm{D})$ and $\lim \inf |u|_{\alpha, \mathrm{D}}<\infty$, then $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$ and $\lim \inf |u|_{\alpha, \mathbf{D}} \geqslant|u|_{1, \mathrm{D}}\left({ }^{20}\right)$.
$\alpha{ }_{1}$
Proof. - For $x \in \mathrm{D}$ let $\mathrm{S}=\mathrm{S}(x, \rho) \subset \mathrm{D}$ then $|u|_{\alpha, \mathrm{S}} \leqslant|u|_{\alpha, \mathbf{D}}$, and it follows from Prop. 1) that $u \in \mathrm{P}^{1}(\mathrm{~S})$; a fortiori $u \in \mathrm{P}_{\mathrm{loc}}^{1}(\mathrm{D})$. Now let $\left\{\mathrm{S}_{k}\right\}, k=1,2, \ldots$ be a disjoint sequence of spheres such that $\mathrm{S}_{k} \subset \mathrm{D}$ and $\left|\mathrm{D}-\bigcup_{k=1}^{\infty} \mathrm{S}_{k}\right|=0$. Then

$$
\sum_{k=1}^{\infty}|u|_{\alpha, \mathrm{s}_{k}}^{2} \leqslant|u|_{\alpha, \mathrm{D}}^{2}
$$

$\left.{ }^{(20}\right)$ By considering $\mathrm{S}(0,1)-\left[x_{1}=0\right]$ in $\mathrm{R}^{2}$ and setting $u\left(x_{1}, x_{2}\right)=0$ for $x_{1}>0$ and $=1$ for $x_{1}<0$ we see that the converse of this proposition is false.
and by Prop. 1),

$$
\infty>\lim _{\alpha \wedge 1} \inf |u|_{\alpha, \mathrm{D}}^{2} \geqslant \sum_{k=1}^{\infty} \lim _{\alpha \wedge 1}|u|_{\alpha, \mathrm{s}_{k}}^{2}=\sum_{k=1}^{\infty}|u|_{1, \mathrm{~s}_{k}}^{2}=|u|_{1, \mathrm{D}}^{2} .
$$

As an immediate application of Prop. 2) we can give another criterion for the extension of functions (cf. Theorem I, § 3) from a given domain to a larger domain.
3) Let $\mathrm{D} \subset \mathrm{D}_{1}$ and $\left|\mathrm{D}_{1}-\mathrm{D}\right|=0$. If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and

$$
\liminf _{\alpha^{\prime} \uparrow m}|u|_{\alpha^{\prime}, \mathbf{D}}<\infty, \quad m=[\alpha],
$$

then $u$ has a unique extension $\tilde{u} \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{D}_{\mathbf{1}}\right)$.
Proof. - Take as $\tilde{u}$ the correction of $u$ in $\mathrm{D}_{1}$. Since

$$
|\tilde{u}|_{\alpha, D_{4}}=|u|_{\alpha, \mathbf{D}}
$$

we need only prove that $\tilde{u} \in \mathrm{P}_{\text {loc }}^{\alpha}\left(\mathrm{D}_{1}\right)$.
Let $q_{i}$ be the correction of $\mathrm{D}_{i} u$ in $\mathrm{D}_{1}$ for $0<|i| \leqslant m$. Then by Prop. 2), $\varsigma_{i} \in \check{\mathrm{P}}^{1}\left(\mathrm{D}_{1}\right)$. The proposition now follows by Prop. $2^{\prime}$ ), $\S 9$, II and Theorem $1, \S 0$.

Remark 4. - In connection with Prop. 3), it might be of interest to introduce the class $\tilde{\mathrm{P}}^{\alpha}(\mathrm{D})$ of all functions which belong to $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and such that $|u|_{\beta, \mathrm{D}}$ is uniformly bounded for all $\beta \leqslant \alpha$. Then, Prop. 3) might be restated «if $\mathrm{D} \subset \mathrm{D}_{1}$ and $\left|D_{1}-\mathrm{D}\right|=0$, each function $u \in \tilde{\mathrm{P}}^{\alpha}(\mathrm{D})$ has a unique extension to $\tilde{\mathrm{P}}^{\alpha}\left(\mathrm{D}_{1}\right)$ ). It is clear that $\mathrm{P}^{\alpha}(\mathrm{D}) \subset \tilde{\mathrm{P}}^{\alpha}(\mathrm{D}) \subset \check{\mathrm{P}}^{\alpha}(\mathrm{D})$, and examples might be given to show that $\tilde{\mathrm{P}}^{\alpha}(\mathrm{D})$ is not always equal to $\mathrm{P}^{\alpha}(\mathrm{D})$ (cf. example 3, § 13).
4) If $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$ and $\lim _{\alpha, 1}|u|_{\alpha, \mathrm{D}}=|u|_{1, \mathrm{D}}$ then for every $\mathrm{D}^{\prime} \subset \mathrm{D}$ such that $\left|\mathrm{D} \cap \partial \mathrm{D}^{\prime}\right|=0{ }_{\text {swe }}^{\alpha \wedge 1}$ have $\lim _{\alpha, 1}|u|_{\alpha, \mathrm{D}^{\prime}}=|u|_{1, \mathrm{D}^{\prime}}$.

$$
\text { Proof. - Let } \mathrm{D}^{\prime \prime}=\mathrm{D}-\overline{\mathrm{D}}^{\prime} \text { then }\left|\mathrm{D}-\left(\mathrm{D}^{\prime} \cup \mathrm{D}^{\prime \prime}\right)\right|=0 \text {, }
$$ $u \in \check{\mathrm{P}}^{1}\left(\mathrm{D}^{\prime}\right)$ and $u \in \check{\mathrm{P}}^{1}\left(\mathrm{D}^{\prime \prime}\right)$. By Prop. 2), $|u|_{1, \mathrm{D}^{\prime}}^{2} \leqslant \lim _{\alpha \wedge 1} \inf |u|_{\alpha, \mathrm{D}}^{2}$ and $|u|_{1, \mathrm{D}^{\prime}}^{2} \leqslant \lim \inf |u|_{\alpha, \mathrm{D}^{D^{\prime}}}^{2}$. From $|u|_{\alpha, \mathrm{D}^{\prime}}^{2}+|u|_{\alpha, \mathrm{D}^{\mathbf{D}^{\prime}}}^{2} \leqslant|u|_{\alpha, \mathbf{D}}^{2}$ it follows that

$$
\begin{aligned}
&|u|_{1, \mathrm{D}}^{2}=|u|_{1, \mathrm{D}^{\prime}}^{2}+|u|_{1, \mathrm{D}^{\prime}}^{2} \leqslant \lim _{\alpha \wedge 1} \sup \\
&|u|_{\alpha, \mathrm{D}^{\prime}}^{2}+\underset{\alpha \wedge 1}{\liminf _{\alpha, 1} \inf }|u|_{\alpha, \mathrm{D}^{\prime}}^{2} \\
& \leqslant \lim _{\alpha \wedge 1}|u|_{\alpha, \mathrm{D}}^{2}=|u|_{1, \mathrm{D}}^{2} .
\end{aligned}
$$

Hence, $\lim _{\alpha \uparrow 1} \sup |u|_{\alpha, \mathbf{D}^{\prime}}^{2}=|u|_{1, \mathbf{D}^{\prime}}^{2} \leqslant \lim _{\alpha \uparrow 1} \inf |u|_{\alpha, \mathbf{D}^{\prime}}^{2}$ and

$$
|u|_{1, \mathbf{D}^{\prime}}^{2}=\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathbf{D}^{\prime} .}^{2}
$$

5) If $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$ then $\lim _{\alpha, 1}|u|_{\alpha, \mathrm{D}}=|u|_{1, \mathrm{D}}$ if and only if for esery $\varepsilon>0$ there is $a \delta>0^{\alpha \wedge 1}$ such that $\lim _{\alpha, 1} \sup _{1}|u|_{\alpha, \mathrm{D}-\overline{\mathbf{D}^{5}}} \leqslant \varepsilon$.

Proof. - Assume that $\lim _{\alpha, 1}|u|_{\alpha, \mathrm{D}}=|u|_{1, \mathrm{D}}$, then by noting that $\left|\mathrm{D} \cap \partial\left(\mathrm{D}-\overline{\mathrm{D}}^{\grave{\delta}}\right)\right|=0$ it follows immediately by Prop. 4) that $\lim _{x \wedge 1}|u|_{\alpha, \mathrm{D}-\overline{\mathbf{D}^{\delta}}}=|u|_{1, \mathrm{D}-\overline{\mathbf{D}^{\bar{s}}}} \leqslant \varepsilon$ for $\delta$ sufficiently small.

Conversely, suppose $\lim \sup |u|_{\alpha, \mathrm{D}-\overline{\mathrm{D}^{\delta}}} \leqslant \varepsilon$. It is easy to see by Lemma $1, \S 1$, and Prop. 7) § 2 that there is an extension $\tilde{u}$ of $u$ restricted to $\mathrm{D}^{\delta / 2}$ which belongs to $\mathrm{P}^{\alpha}$. Hence by applying Prop. 4) to $\mathrm{D}^{\delta / 2} \subset \mathrm{R}^{n}$ we have that $\lim _{\alpha, 1}|u|_{\alpha, \mathrm{D}^{\delta / 2}}=|u|_{1, \mathrm{D}^{\delta / 2}}$. Since

$$
\operatorname{dist}\left(\mathrm{D}-\mathrm{D}^{\hat{\delta} / 2}, \mathrm{D}^{\hat{\delta}}\right)=\delta / 2
$$

it is clear from the properties of $\mathrm{G}_{2 n+2 \alpha}(x)\left({ }^{21}\right)$ and (2.7) that

$$
\begin{aligned}
& |u|_{\alpha, \mathrm{D}}^{2} \leqslant|u|_{\alpha, \mathrm{D}^{i / 2}}^{2}+|u|_{\alpha, \mathrm{D}-\overline{\mathrm{D}^{\bar{s}}}}^{2}+\frac{2}{\mathrm{C}(n, \alpha) \mathrm{G}_{2 n+2 \alpha}(0)} \\
& \times \int_{\mathrm{D}^{\delta}} \int_{\mathrm{D}-\mathrm{D}^{\bar{\beta} / 2}} \mathrm{G}_{2 n+2 \alpha}(x-y) \frac{|u(x)-u(y)|^{2}}{|x-y|^{n+2 \alpha}} d x d y \\
& \leqslant|u|_{\alpha, \mathrm{D}^{\delta / 2}}^{2}+|u|_{\alpha, \mathrm{D}-\overline{\mathrm{D}^{\delta}}}^{2}+\left(\frac{\delta}{2}\right)^{-2 \alpha} \frac{8 \omega_{n}}{2 \alpha \mathrm{C}(n, \alpha)}|u|_{0, \mathrm{D}}^{2} \\
& \leqslant|u|_{\alpha, \mathrm{p}^{\delta / 2}}^{2}+|u|_{\alpha, \mathrm{D}-\overline{\mathrm{D}^{\delta}}}^{2}+32 n \delta^{-2}(1-\alpha)|u|_{0, \mathrm{D}}^{2} .
\end{aligned}
$$

Hence, $\lim _{\alpha \wedge 1} \sup |u|_{\alpha, \mathbf{D}}^{2} \leqslant|u|_{1, \mathrm{D}}^{2}+\varepsilon^{2}$. Therefore, since $\varepsilon$ is arbitrary and by Prop. 2), $\lim _{\alpha \uparrow 1}^{\alpha, 1} \inf |u|_{\alpha, \mathrm{D}} \geqslant|u|_{1, \mathrm{D}}$, we have

$$
\lim _{\alpha \wedge 1}|u|_{\alpha, \mathrm{D}}=|u|_{1, \mathrm{D}} .
$$

6) If T is a $\mathrm{C}^{(0.1)}$ homeomorphism of $\mathrm{D}^{*}$ onto D then $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$ and $\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathrm{D}}=|u|_{1, \mathrm{D}}$ implies $u^{*} \in \check{\mathrm{P}}^{1}\left(\mathrm{D}^{*}\right)$ and

$$
\lim _{\alpha \wedge 1}\left|u^{*}\right|_{\alpha, \mathbf{D}^{*}}=\left|u^{*}\right|_{1, \mathbf{D}^{*}}
$$

where $u^{*}\left(x^{*}\right)=u\left(\mathrm{~T} x^{*}\right)$.
$\left.{ }^{(21}\right)$ In particular $\mathrm{G}_{2 n+2 \alpha}(x) / \mathrm{G}_{2 n+2 \alpha}(0) \leqslant 1$.

Proof. - By Prop. 8), $\S 2, u^{*} \in \check{\mathrm{P}}^{1}\left(\mathrm{D}^{*}\right)$. If M is the common Lipschitz constant of $T$ and $\mathrm{T}^{-1}, \mathrm{~T}\left(\mathrm{D}^{*}-\overline{\mathrm{D}^{* \delta / \mathrm{M}}}\right) \subset \mathrm{D}-\overline{\mathrm{D}}^{\delta}$. Then by Prop. 8), § 2, $|u|_{\alpha, \mathrm{D}^{*}-\widetilde{\mathrm{D}^{* / / M}}}^{2} \leqslant \mathrm{CM}^{\alpha+\frac{3}{2} n}|u|_{\alpha, \mathrm{D}-\overline{\mathrm{D}^{\delta}} \text {. An }}$ application of the preceding proposition completes the proof.

In Remark 3, § 2, we noted that $|u\rangle_{\alpha, \mathbf{D}}^{2}-|u|_{\alpha, \mathbf{D}}^{2} \downarrow 0$ as $\alpha \uparrow 1$. It can be shown that

$$
\begin{align*}
0 \leqslant|u\rangle_{\alpha, \mathrm{D}}^{2} & -|u|_{\alpha, \mathrm{D}}^{2}  \tag{4.6}\\
& \leqslant 4\left(n+\log \frac{e}{1-\alpha_{0}}\right)\left(\frac{\alpha}{\alpha_{0}}\right)(1-\alpha)|u|_{\alpha_{0}, \mathbf{D}}^{2}
\end{align*}
$$

for $0<\alpha_{0} \leqslant \alpha<1$ and $u \in \check{P}^{\alpha}(D)$. If we interpret the difference in the inequality as the integral of the difference of the integrands the inequality is valid for all $u \in \check{\mathrm{P}}^{\alpha_{0}}(\mathrm{D})$.

To characterize the behavior of $d_{\alpha, \mathrm{D}}(u)$ as $\alpha \downarrow 0$ we introduce the function

$$
\begin{equation*}
\delta(\alpha) \equiv \delta(\alpha, \mathrm{D})=\frac{2}{\mathrm{C}(n, \alpha)} \int_{\mathrm{D} n[y \mid>1]} \frac{1}{|y|^{n+2 \alpha}} d y \tag{4.7}
\end{equation*}
$$

7) If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ for some $\alpha, 0<\alpha<1$, then

$$
\lim _{\alpha^{\prime} \psi 0}\left(d_{\alpha^{\prime}, \mathbf{D}}(u)-\delta\left(\alpha^{\prime}\right)|u|_{0, \mathbf{D}}^{2}\right)=0
$$

To prove this we need the following lemma.
Lemma 2. - For $0<\alpha<1, a) \delta(\alpha, \mathrm{D}) \leqslant 2 n$ for all D , $\lim _{\alpha, \gamma 0} \delta\left(\alpha, \mathrm{R}^{n}\right)=1$ and if D is bounded, $\lim _{\alpha, 0} \delta(\alpha, \mathrm{D})=0$.
b) Let D be a fixed domain. Put

$$
\delta(x, \mathrm{R}, \alpha)=\frac{2}{\mathrm{C}(n, \alpha)} \int_{|x-y|>2 \mathrm{R}} \frac{1}{|x-y|^{n+2 \alpha}} d y
$$

for $\mathrm{R}>1$ and $x \in \mathrm{D} \cap[|x|<\mathrm{R}]$. Then $\delta(x, \mathrm{R}, \alpha) \leqslant 2 n$ and $\lim _{\alpha \vee 0} \sup ^{2}|\delta(\alpha)-\delta(x, \mathrm{R}, \alpha)|=0$ uniformly in $x$ for

$$
x \in \mathrm{D} \cap[|x|<\mathrm{R}] .
$$

Proof. - By (2.7),

$$
\delta(\alpha, \mathrm{D}) \leqslant \frac{2}{\mathrm{C}(n, \alpha)} \int_{|y|>1}|y|^{-n-2 \alpha} d y=\frac{\omega_{n}}{\alpha \mathrm{C}(n, \alpha)} \leqslant 2 n .
$$

It is clear from (1.3), II, that $\delta\left(\alpha, \mathrm{R}^{n}\right)=\frac{\omega_{n}}{\alpha \mathrm{C}(n, \alpha)} \rightarrow 1$ as
$\alpha \downarrow 0$. If $\mathrm{D} \subset \mathrm{S}(0, \mathrm{R})$ then $\delta(\alpha, \mathrm{D}) \leqslant 2 n\left(1-\mathrm{R}^{-2 \alpha}\right) \downarrow 0$ as $\alpha \downarrow 0$ which completes the proof of part $a)$.

For $\mathrm{R}>1$ and $x \in \mathrm{D} \cap[|x|<\mathrm{R}],|y|>3 \mathrm{R}$ implies

$$
|x-y|>2 \mathrm{R}
$$

hence

$$
\begin{aligned}
\delta(\alpha)-\delta(x, \mathrm{R}, \alpha)= & \frac{2}{\mathrm{C}(n, \alpha)} \int_{\substack{1<|y|<3 \mathrm{R}}}|y|^{-n-2 \alpha} d y \\
& \quad-\frac{2}{\mathrm{C}(n, \alpha)} \int_{\substack{\mathbf{D} \\
|x<y|<3 \mathrm{R} \\
|x-y|>2 \mathrm{R}}}|y-x|^{-n-2 \alpha} d y \\
+ & \frac{2}{\mathrm{C}(n, \alpha)} \int_{\substack{|y|>3 \mathrm{R}}}\left(|y|^{-n-2 \alpha}-|x-y|^{-n-2 \alpha}\right) d y
\end{aligned}
$$

The integrand of the third term is majorated by $(n+2 \alpha)|x|(\min [|y|,|x-y|])^{-n-2 \alpha-1}$

$$
\leqslant(n+2 \alpha) \mathrm{R} \cdot\left(\frac{2}{3}|y|\right)^{-n-2 \alpha-1}
$$

Therefore by (2.7)

$$
\begin{aligned}
&|\delta(\alpha)-\delta(x, \mathrm{R}, \alpha)| \leqslant 2 n\left(1-(3 \mathrm{R})^{-2 \alpha}\right)+2 n\left((2 \mathrm{R})^{-2 \alpha}\right. \\
&\left.-(4 \mathrm{R})^{-2 \alpha}\right)+\frac{(n+2 \alpha)}{(1+2 \alpha)} 2 n \alpha(1-\alpha)\left(\frac{2}{3}\right)^{-n-2 \alpha}(3 \mathrm{R})^{-2 \alpha}
\end{aligned}
$$

which establishes the convergence in part $b$ ). The bound for $\delta(x, \mathrm{R}, \alpha)$ is obtained the same way as for $\delta(\alpha)$.

Proof of Prop. 7). - Let $u \in \check{\mathrm{P}}^{\alpha_{0}}(\mathrm{D})$ and $\alpha<\alpha_{0}<1$. Given $\varepsilon>0$, choose $R$ sufficiently large $(R>1)$ so that

$$
|u|_{0, \mathrm{D} \cap[|x|>\mathrm{R}]}^{2}<\varepsilon .
$$

Then

$$
\begin{aligned}
d_{\alpha, \mathbf{D}}(u) & =\frac{1}{\mathrm{C}(n, \alpha)}\left\{\int_{\substack{\mathbf{D} \\
|x \rightarrow y|<2 \mathrm{R}}} \int_{\mathbf{D}} \frac{|u(x)-u(y)|^{2}}{|x-y|^{n+2 \alpha}} d x d y\right. \\
& +\int_{\substack{|x \rightarrow y|>2 \mathbf{D} \\
|x|>\mathbf{R},|\mathbf{D}|>\mathbf{R}}} \int_{\mathbf{D}} \frac{|u(x)-u(y)|^{2}}{|x-y|^{n+2 \alpha}} d x d y \\
& \left.+2 \int_{\substack{\mathbf{D} \\
|x|<\mathbf{R},|||>\mathbf{R}\\
| x-y|>2 \mathbf{R}}} \int_{\mathbf{D}} \frac{|u(x)|^{2}+|u(y)|^{2}-2 \operatorname{Re} u(x) \overline{u(y)}}{|x-y|^{n+2 \alpha}} d x d y\right\} .
\end{aligned}
$$

The first and second terms are bounded by

$$
\alpha \frac{\mathrm{C}\left(n, \alpha_{0}\right)(2 \mathrm{R})^{2 \alpha_{0}} 2 n}{\omega_{n}} d_{\alpha_{0}, \mathrm{D}}(u)
$$

and $4 n \varepsilon$ respectively. Since

$$
\begin{aligned}
\left\lvert\, \frac{2}{\mathrm{C}(n, \alpha)}\right. & \int_{\substack{|x||\mathbf{D},||| \\
|x-y|>2 \mathrm{R}}} \int_{\substack{ }} \frac{|u(x)|^{2}+|u(y)|^{2}-2 \operatorname{Re}}{|x-y|^{n+2 \alpha}} u(x) \overline{u(y)} \\
& \quad-\left.\int_{\substack{\mathbf{D} \\
|x|<\mathrm{R}}} \delta(x, \mathrm{R}, \alpha)|u(x)|^{2} d x\left|\leqslant 2 n \varepsilon+4 n \varepsilon^{\frac{1}{2}}\right| u\right|_{0, \mathbf{D}}
\end{aligned}
$$

it follows by Lemma 2 that

$$
\left.\left.\limsup _{\alpha, 0}\left|d_{\alpha, \mathrm{D}}(u)-\delta(\alpha)\right| u\right|_{0, \mathrm{D}} ^{2}\left|\leqslant 8 n \varepsilon+4 n \varepsilon^{\frac{1}{2}}\right| u\right|_{\mathbf{0 , \mathrm { D }}}
$$

and the proposition follows.
It is clear from the above that for bounded domains,

$$
\lim _{\alpha \neq 0} \delta(\alpha)=0 ;
$$

consequently, $d_{\alpha, \mathbf{0}}(u)$ as $\alpha \downarrow 0$ depends only the the behavior of $D$ in a neighborhood of $\infty$. Furthermore, if

$$
\mathrm{D}=\mathrm{R}^{n}, \quad \lim _{\alpha \vee 0} \delta(\alpha)=1,
$$

and examples can be constructed (cf. example 5, § 13) so that $\lim _{\alpha \nsim 0} \inf \delta(\alpha)=a$, $\lim _{\alpha \vee 0} \sup \delta(\alpha)=b$ for arbitrary $a, b$; $0 \leqslant a \leqslant b \leqslant 1$.

In contrast with $\mid u\rceil_{\alpha, \mathbf{D}},|u|_{\alpha, \mathrm{D}}$ is continuous from the right at $\alpha=0$ and the next proposition gives an estimate for the modulus of continuity.
8) If $u \in \check{\mathrm{P}}^{\alpha_{0}}(\mathrm{D}), 0<\alpha_{0}<1$, then for $\alpha \leqslant \alpha_{0}\left(1-\alpha_{0}\right) / e$, $0 \leqslant|u|_{\alpha, \mathrm{D}}^{2}-|u|_{\mathbf{0}, \mathrm{D}}^{2}$

$$
\leqslant \frac{2 \alpha}{\alpha_{0}\left(1-\alpha_{0}\right)}\left(\log \frac{\alpha_{0}\left(1-\alpha_{0}\right)}{\alpha}\right)^{\gamma}\left(\frac{\sqrt{\pi}}{\Gamma_{0}}+4 e n\right)|u|_{\alpha_{0}, \mathrm{D}}^{2}
$$

where $\Gamma_{0}=\min _{1<\beta<2} \Gamma(\beta)$ (approximately. 88560) and

$$
\gamma=\max \left(2 \alpha_{0}, \frac{n}{2}-\frac{1}{2}\right) .
$$

Proof. - By (1.3), II, it is easy to check that for

$$
\begin{aligned}
& 0<\alpha<\alpha_{0}<1 \\
& \frac{\mathrm{C}\left(n, \alpha_{0}\right)}{\mathrm{C}(n, \alpha)} \leqslant \frac{\alpha(1-\alpha)}{\alpha_{0}\left(1-\alpha_{0}\right)} \cdot \frac{\sqrt{\pi}}{\Gamma_{0}} \cdot \text { Hence by }(4.5),(2.7), \text { and }(2.4), \\
& \text { we have for } r \geqslant 1, \\
& 0 \leqslant|u|_{\alpha, \mathrm{D}}^{2}-|u|_{0, \mathrm{D}}^{2}=\frac{1}{\mathrm{C}(n, \alpha) \mathrm{G}_{2 n+2 \alpha}(0)}\left\{\int_{|x-y|<r} \int_{\mathbf{D}}\right. \\
& \left.\quad+\int_{|x-y|>r} \int_{\mathbf{D}} \frac{\mathrm{G}_{2 n+2 \alpha}(x-y)}{|x-y|^{n+2 \alpha}}|u(x)-u(y)|^{2} d x d y\right\} \\
& \quad \leqslant r^{2 \alpha_{0}-2 \alpha} \frac{\mathrm{C}\left(n, \alpha_{0}\right)}{\mathrm{C}(n, \alpha)} d_{\alpha_{0}, \mathrm{D}}(u)+4 n(1-\alpha) \frac{\mathrm{G}_{2 n+2 \alpha}(r) r^{-2 \alpha}}{\mathrm{G}_{2 n+2 \alpha}(0)}|u|_{0, \mathrm{D}}^{2} \\
& \quad \leqslant\left\{\frac{\alpha r^{2 \alpha_{0}}}{\alpha_{0}\left(1-\alpha_{0}\right)} \frac{\sqrt{\pi}}{\Gamma_{0}}+4 n r^{-\alpha+\frac{n}{2}-\frac{1}{2}} e^{1-r}\right\} 2|u|_{\alpha_{0}, \mathrm{D}}^{2} .
\end{aligned}
$$

The proof is completed by setting $r=\log \frac{\alpha_{0}\left(1-\alpha_{0}\right)}{\alpha} \geqslant 1$.
Remarks on the spaces $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D})$. All the results of this section remain true for the spaces $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D}), 1<p<\infty$, with analogous proofs. Some of the proofs were already given in [2] for $\mathrm{D}=\mathrm{R}^{n}$.

## 5. Localization and L-convex domains.

In this section we make some rather general definitions which will be used in subsequent sections to localize various properties of domains. We will be especially interested in boundary properties, i.e. properties of $\partial \mathrm{D}$ relative to D . (If $\partial \mathrm{D}$ is the boundary of another domain $\mathrm{D}_{1}, \partial \mathrm{D}$ relative to $\mathrm{D}_{1}$ will not necessarily satisfy the same properties as $\partial \mathrm{D}$ relative to D.) As an immediate application we define the L-convex domains and establish some of their more useful properties.

A $\delta$-loose covering of an arbitrary set $A \subset R^{n}$ is an open covering $\left\{\mathrm{U}_{k}\right\}$ of $A$ such that $\mathrm{A} \subset \bigcup_{k} \mathrm{U}_{k}^{\delta}$. In cases where it is not necessary to make $\delta$ explicit we shall call it a loose covering.

[^3]A covering with rank $p$ ( $p$ a positive integer) of an arbitrary set $\mathrm{A} \subset \mathrm{R}^{n}$ is an open covering $\left\{\mathrm{U}_{k}\right\}$ such that for each $k$, $\mathrm{U}_{k} \cap \mathrm{U}_{l} \neq 0$ for at most $p$ indices $l$. In cases where it is not necessary to make $p$ explicit, we shall call it a covering with finite rank.

Consider a boundary property $(\mathbf{P})$; we say the open set $D$ satisfies the weakly localized boundary property ( P ), and for brevity we write $D$ satisfies $\left(\mathrm{P}_{w l}\right)$, if for each $x \in \partial D$ there exists a neighborhood $\mathrm{N}_{x}$ of $x$ such that $\mathrm{N}_{x} \cap \mathrm{D}$ satisfies $(\mathrm{P})$.

Remark 1. - This definition is weaker than the usual definition of localization in that the usual definition requires that ( P ) be satisfied by $\mathrm{N}_{x} \cap \mathrm{D}$ with $\mathrm{N}_{x}$ as small as we please.

For our needs we must introduce a much more restrictive definition which we call strong localization.

Consider the boundary property ( P ). We say that D satisfies the strongly localized boundary property ( P ) with constants $\delta$ and $p$; for brevity we write D satisfies ( $\mathrm{P}_{s l, \delta, p}$ ), if there exists a $\delta$-loose covering with rank $p,\left\{\mathrm{U}_{k}\right\}$ of $\partial \mathrm{D}$ such that for each $k, \mathrm{U}_{k} \cap \mathrm{D}$ satisfies ( P ).

We say D satisfies the strongly localized boundary property $(\mathrm{P})$; for brevity, D satisfies $\left(\mathrm{P}_{s l}\right)$ if there exists a ô and $p$ such that D satisfies $\left(\mathrm{P}_{s l, \delta, p}\right)$.

Remark 2. - For $\partial \mathrm{D}$ compact, $\left(\mathrm{P}_{w l}\right)$ is equivalent to $\left(\mathrm{P}_{s l}\right)$.
If property $(\mathrm{P})$ is stronger than property $\left(\mathrm{P}^{\prime}\right)$, i.e.D satisfies $(P)$ implies $D$ satisfies $\left(P^{\prime}\right)$ for all $D$, we shall write $(P) \succ\left(P^{\prime}\right)$ (or $\left(\mathrm{P}^{\prime}\right) \prec(\mathrm{P})$ ). If $(\mathrm{P}) \prec\left(\mathrm{P}^{\prime}\right)$ and $\left(\mathrm{P}^{\prime}\right) \prec(\mathrm{P})$, then we write $(\mathbf{P}) \equiv\left(\mathrm{P}^{\prime}\right)$.

With this symbolism we list the following without proof.

$$
\begin{equation*}
(\mathrm{P}) \succ\left(\mathrm{P}_{s l, \delta, p}\right) \succ\left(\mathrm{P}_{s l}\right) \succ\left(\mathrm{P}_{w l}\right) . \tag{5.1a}
\end{equation*}
$$

(5.1b) $\quad(\mathrm{P}) \succ\left(\mathrm{P}^{\prime}\right)$ implies $\left(\mathrm{P}_{s, \delta, \mathrm{p}}\right) \succ\left(\mathrm{P}_{s l, \delta, p}^{\prime}\right), \quad\left(\mathrm{P}_{s l}\right) \succ\left(\mathrm{P}_{s l}^{\prime}\right)$ and $\left(\mathrm{P}_{w l}\right) \succ\left(\mathrm{P}_{w l}^{\prime}\right)$.

$$
\begin{equation*}
\left(\mathrm{P}_{s l, \hat{,}, p}\right) \succ\left(\left(\mathrm{P}_{\left.s l, \hat{j}^{\prime}, p^{\prime}\right)}\right)_{s l, \hat{0}, p}\right) \succ\left(\mathrm{P}_{w l}\right) . \tag{5.1c}
\end{equation*}
$$

(5.1d) If $\delta \geqslant \delta^{\prime}$ and $p \leqslant p^{\prime}$ then $\left(\mathrm{P}_{s l, \delta, p}\right) \succ\left(\mathrm{P}_{s, \delta^{\prime}, p^{\prime}}\right)$.
(5.1e) If $(\mathrm{P}) \succ\left(\mathrm{P}^{\prime}\right), \delta \geqslant \delta^{\prime}$ and $p \leqslant p^{\prime}$, then

$$
\left(\mathrm{P}_{s, \delta, \bar{p}}\right) \succ\left(\mathrm{P}_{s l, \delta_{0}^{\prime}, p^{\prime}}^{\prime}\right) .
$$

Lemma 1. - If $\left\{\mathrm{U}_{k}\right\}$ is a covering with rank $p<\infty$ then the sequence $\{k\}=\{1,2, \ldots\}$ can be divided into at most $p$
mutually disjoint subsequences $\left\{k_{l}^{(1)}\right\},\left\{k_{l}^{(2)}\right\}, \ldots$ such that each of the corresponding sequences $\left\{\mathrm{U}_{k_{l}^{(i)}}\right\}$ is composed of mutually disjoint sets.

Proof. - Denote by $\left\{\mathrm{U}_{k_{l}^{(1)}}\right\}$ a maximal subsequence of mutually disjoint sets. If $\left\{\mathrm{U}_{k_{l}^{(i-1)}}\right\}$ is already defined, choose a maximal subsequence of mutually disjoint sets among the $\mathrm{U}_{k}$ 's not belonging to $\left\{\mathrm{U}_{k_{l}^{(1)}}\right\}, \ldots,\left\{\mathrm{U}_{k_{l}^{(i-1)}}\right\}$. If the first $p$ such sequences did not exhaust $\left\{\mathrm{U}_{k}\right\}$, the remaining $\mathrm{U}_{k}$ 's would satisfy $\mathrm{U}_{k} \cap \mathrm{U}_{h} \neq 0$ for some index $h$ in each of the sequences $k_{l}^{(i)}, i=1, \ldots, p$.

Lemma 2. - If $\mathrm{U}_{k}$ is a $\delta$-loose cosering with rank $p$ of an arbitrary set $\mathrm{A} \subset \mathrm{R}^{n}$, then there exists a partition of unity corresponding to $\mathrm{U}_{k}$, $\psi_{k}(x)$, such that
i) $0 \leqslant \psi_{k}(x) \leqslant 1, \quad \psi_{k} \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right), \quad \psi_{k}(x)=0$ outside $\mathrm{U}_{k}^{\partial / 3}$ and $\sum_{k} \psi_{k}(x)=1$ for $x \in \mathrm{~S}(\mathrm{~A}, \delta / 8)$, the $\delta / 8$ neighborhood of A .
ii) $\left|\mathrm{D}_{i} \psi_{k}(x)\right| \leqslant \delta^{-|i|} \mathrm{C}_{i i}, \mathrm{C}_{m}$ depending only on $p$, $n$, and $m$.

Proof. - By Lemma 1, § 1, there exists

$$
\varphi_{k}(x), \quad 0 \leqslant \varphi_{k}(x) \leqslant 1, \quad \varphi_{k} \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right),
$$

such that $\varphi_{0}(x)=1$ on $\overline{\mathrm{S}(\mathrm{A}, \delta / 8)} \subset(\mathrm{S}(\mathrm{A}, \delta / 4))^{\delta / 9}$ and $=0$ outside $\mathrm{S}(\mathrm{A}, \delta / 4)$; for $k \geqslant 1, \varphi_{k}(x)=1$ on $\overline{\mathrm{U}_{k}^{2 \delta / 3}}$ and $\varphi_{k}(x)=0$ outside $\mathrm{U}_{k}^{\ell / 3}$; and $\left|\mathrm{D}_{i} \varphi_{k}(x)\right| \leqslant \delta^{-|i|} \mathrm{C}_{|i|}^{\prime}$, and $\mathrm{C}_{|i|}^{\prime}$ depends only on $n$ and $|i|$.

Since $1 \leqslant \sum_{k \geqslant 1} \varphi_{k}(x) \leqslant p$ on $\mathrm{S}(\mathrm{A}, \delta / 4)$ for $k \geqslant 1$ we define

$$
\psi_{k}(x)=\left\{\begin{array}{ccc}
\varphi_{0}(x) \varphi_{k}(x) & \text { for } & x \in \mathrm{~S}(\mathrm{~A}, \delta / 4) \\
\sum_{l \geqslant 1} \varphi_{l}(x) & \\
0 & \text { for } & x \notin \mathrm{~S}(\mathrm{~A}, \delta / 4)
\end{array}\right.
$$

and $\psi_{k}(x)$ satisfies the requirements of the Lemma.
A domain $\mathrm{D} \subset \mathrm{R}^{n}$ is $\mathrm{C}^{(0,1)}$-convex with bound M if there is a $\mathrm{C}^{(0,1)}$-homeomorphism T defined on D such that $\mathrm{T}(\mathrm{D}) \subset \mathrm{R}^{n}$ is convex and the Lipschitz constants of T and $\mathrm{T}^{-1}$ are $\leqslant \mathrm{M}$ (note that $\mathrm{M} \geqslant 1$ ).

A domain $\mathrm{D} \subset \mathrm{R}^{n}$ is an L-convex domain with constants $\delta, p$ and M (we shall usually suppress « with constants $\delta, p$, and M » unless the constants are explicity needed) if D satisfies ( $\mathrm{P}_{s, \hat{0}, \mathrm{p}}$ ) where property ( P ) means ${ }^{\text {( } \mathrm{C}^{(0,1)} \text {-convex with }}$
bound M », i.e. there is a $\delta$-loose covering with rank $p$ of $\partial \mathrm{D}$, say, $\left\{\mathrm{U}_{k}\right\}$, and $\mathrm{C}^{(0,1)}$-homeomorphisms $\mathrm{T}_{k}$ defined on $\mathrm{U}_{k} \cap \mathrm{D}$, $k=1,2, \ldots$, such that $\mathrm{T}_{k}\left(\mathrm{U}_{k} \cap \mathrm{D}\right) \subset \mathrm{R}^{n}$ is convex and the Lipschitz constants of $\mathrm{T}_{k}$ and $\mathrm{T}_{k}^{-1}$ are bounded by M.

L-convex domains will be studied extensively throughout the rest of this paper because many of the properties of convex domains with regard to Bessel potentials carry over to L-convex domains as we shall illustrate in the next proposition (cf. Prop. 1), § 4).

1) If D is an L-convex domain swith constants $\delta, p$ and M (and we assume for simplicity that $\delta \leqslant 1$ ) then
a) for $\alpha \leqslant \gamma, \quad{ }_{\mathrm{P}}{ }^{\alpha}(\mathrm{D}) \supset \check{\mathrm{P}}^{\gamma}(\mathrm{D})$ and $|u|_{\alpha, \mathrm{D}} \leqslant \mathrm{C}|u|_{\gamma, \mathrm{D}} \quad$ where $\mathrm{C}=\left(\delta^{-1}+p^{1 / 2} \mathrm{M}^{2+3 n}\right) \mathrm{C}^{\prime}$ and $\mathrm{C}^{\prime}$ depends only on $n$.
b) If $u$ is a corrected function in ${ }^{\mathrm{P}} \alpha(\mathrm{D}), 0 \leqslant \alpha<\alpha_{0}$ then $|u|_{\alpha, \mathrm{D}}$ is a continuous function of $\alpha$ for $0 \leqslant \alpha<\alpha_{0}$ and

$$
\lim _{\alpha \wedge \alpha_{0}}|u|_{\alpha, \mathrm{D}}
$$

always exists (possibly $=+\infty$ ). The limit is finite if and only if $u \in \check{\mathrm{P}} \alpha_{0}(\mathrm{D})$ and in this case the limit is equal to $|u|_{\alpha_{0}, \mathrm{D}}$.

Proof of part a). - By Prop. 3, § 1 (localized) it is sufficient to prove the inequality and by the definition of $|u|_{\alpha, \mathrm{D}}^{2}$ we may restrict ourselves to $0 \leqslant \alpha<\gamma \leqslant 1$. We may also assume that $u \in \check{\operatorname{Pr}} \curlyvee(\mathrm{D})$.

If $\left\{\mathrm{U}_{k}\right\}$ is the covering of $\partial \mathrm{D}$, we set

$$
\begin{equation*}
\mathrm{V}_{1}=\bigcup_{k=1}^{\infty} \mathrm{U}_{k}^{\delta / 4}, \quad \mathrm{~V}_{2}=\mathrm{D}-\overline{\bigcup_{k=1}^{\infty} \mathrm{U}_{k}^{(7 / 8) \delta}} . \tag{5.2}
\end{equation*}
$$

One checks easily that $\left\{\mathrm{V}_{1}, \mathrm{~V}_{2}\right\}$ is a $\delta / 4$ loose covering of D .
By Prop. 1) and 8) of § 2, and Prop. 1), §4, there is a constant $\mathrm{C}_{1}$ depending only on $n$ such that

$$
|u|_{\alpha, \mathrm{DnU}}^{k}, ~ \leqslant \mathrm{C}_{1} \mathrm{M}^{\alpha+\gamma+3 n}|u|_{\gamma, \mathrm{Dnv}}^{k}, \quad, \quad k=1,2, \ldots .
$$

From the fact that $\operatorname{dist}\left(\mathrm{V}_{2}, \mathrm{R}^{n}-\mathrm{D}\right) \geqslant \delta / 8$, we see by Lemma 1, § 1 and Prop. 7, § 2 that there is a $\varphi \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right)$ such that $\Psi u \in$ P̌P $^{\gamma} \gamma$ (extended by 0 outside D) and

$$
|u|_{\alpha, \mathrm{DN},}^{2} \leqslant|\varphi u|_{\alpha, \mathrm{R}^{n}}^{2} \leqslant|\varphi u|_{\gamma, \mathrm{R}^{n}}^{2} \leqslant \mathrm{C}_{2} \delta^{-2 \gamma}|u|_{\gamma, \mathrm{D}}^{2}
$$

where $\mathrm{C}_{2}$ depends only on $n$.

Hence by (2.7) (and the fact that $\mathrm{G}_{2 n+2 \alpha}(x)$ is a decreasing function of $|x|$ ) we have

$$
\begin{aligned}
|u|_{\alpha, \mathrm{D}}^{2} \leqslant & |u|_{\alpha, \mathrm{DNv}}^{2} \\
& +\sum_{k}|u|_{\alpha, \mathrm{Dn}}^{2} \\
& \leqslant \frac{1}{\mathrm{C}(n, \alpha)} \int_{\mid \mathcal{D}} \int_{\mid \mathbf{D}} \frac{|u(x)-u(y)|^{2}}{|x-y|^{n+2 \alpha}} d x d y \\
& \leqslant \mathrm{C}_{2} \delta^{-2 \gamma}|u|_{\gamma, \mathrm{D}}^{2}+\mathrm{C}_{\mathbf{1}}^{2} \mathrm{M}^{2(\alpha+\gamma+3 n)} \sum \sum|u|_{\gamma, \mathbf{D}_{n} \mathrm{U}_{k}}^{2}+4 n \delta^{-2 \alpha}|u|_{0, \mathrm{D}}^{2} \\
& \leqslant\left(\mathrm{C}_{2} \delta^{-2 \gamma}+p \mathrm{C}_{1}^{2} \mathrm{M}^{2(\alpha+\gamma+3 n)}+4 n \delta^{-2 \alpha}\right)|u|_{\gamma, \mathrm{D}}^{2},
\end{aligned}
$$

which completes the proof of this part.
The proof of part $b$ ) is based on the following lemma:
Lemma 3. - Let $\left\{\mathrm{U}_{k}\right\}$ be a loose covering of finite rank of D and let $u \in \mathrm{P}_{\mathrm{loc}}^{1}(\mathrm{D})$ satisfy
i) $\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathrm{DnO}}^{k} \boldsymbol{}=|u|_{1, \mathrm{DnU}}^{k}, ~<\infty, k=1,2, \ldots$;
ii) if $\left\{\mathrm{U}_{k}\right\}$ is infinite there is a constant C such that for each $k$ and $\alpha \leqslant 1,|u|_{\alpha, \mathrm{DnO}_{k}} \leqslant \mathrm{C}|u|_{1, \mathrm{DnU}_{k}}$.

Then $\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathrm{D}}$ exists and is finite if and only if $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$. If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$, the limit is equal to $|u|_{1, \mathrm{D}}$.

Proof. - If the covering is finite clearly $u \in \check{P}^{1}(\mathrm{D})$ and we need only prove that $\lim _{\alpha, 1}|u|_{\alpha, \mathrm{D}}=|u|_{1, \mathrm{D}}$ which we now prove by induction. The statement is obvious if the covering consists of one set. Suppose next that the covering consists of two sets, $\mathrm{U}_{1}$ and $\mathrm{U}_{2}$. Given $\varepsilon>0$, choose $\delta^{\prime}, 0<\delta^{\prime} \leqslant \delta$, sufficiently small so that $|u|_{1,\left(\mathrm{U}_{1}-\overline{\left.\mathrm{U}_{i}^{\beta^{\prime}}\right) \mathrm{DD}}\right.}<\varepsilon$ and $\mathrm{D}_{2}=\mathrm{D}-\overline{\mathrm{U}_{1}^{\delta^{\prime}}} \subset \mathrm{U}_{2}$. Then by Prop. 4, §4 (with $\mathrm{D}_{2} \subset \mathrm{D} \cap \mathrm{U}_{2}$ ), $\lim _{\alpha, 1}|u|_{\alpha, \mathrm{D}_{2}}=|u|_{1, \mathrm{D}_{\mathbf{2}}}$. Now

$$
\operatorname{dist}\left(\mathrm{D}-\overline{\mathrm{U}}_{\mathbf{1}}, \mathrm{D} \cap \mathrm{U}_{\mathbf{1}}^{\mathbf{\prime}^{\prime}}\right) \geqslant \delta^{\prime} .
$$

Therefore by (2.7) we see easily that

$$
\begin{aligned}
& \lim _{\alpha \uparrow 1} \sup \\
&|u|_{\alpha, \mathrm{D}}^{2} \leqslant \lim _{\alpha \uparrow 1} \sup \left(|u|_{\alpha, \mathrm{DnU}}^{2}+|u|_{\alpha, \mathrm{D}_{\mathbf{e}}}^{2}\right. \\
&\left.+\frac{4}{\mathrm{C}(n, \alpha)} \int_{\mathbf{D}}|u(x)|^{2} \int_{|x-y|>\nabla^{\prime}}|x-y|^{-n-2 \alpha} d x d y\right) \\
&=|u|_{1, \mathrm{DNO}}^{2}+|u|_{1, \mathrm{D}_{2}}^{2} \leqslant|u|_{1, \mathrm{D}}^{2}+\varepsilon^{2} .
\end{aligned}
$$

Since $\varepsilon$ is arbitrary the proof in this case follows by Prop. 2), § 4.

Suppose now the proposition is true for coverings with $m$ sets, $m \geqslant 2$, and the covering of D contains $m+1$ sets. Then $\mathrm{D}^{\prime}=\mathrm{D} \cap \bigcup_{k=1}^{m} \mathrm{U}_{k}^{\delta / 2}$ has a finite loose covering of $m$ sets, viz., $\mathrm{U}_{1}, \ldots, \mathrm{U}_{m}$. By Prop. 4), §4,

$$
\lim _{\alpha \uparrow \mathbf{1}}|u|_{\alpha, \mathbf{D}^{\prime} \cap \mathrm{U}_{k}}=|u|_{1, \mathbf{D}^{\prime} \cap \mathrm{U}_{k}}, \quad k=1, \ldots, m
$$

Thus by the inductive hypotheses, $\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathbf{D}^{\prime}}=|u|_{1, \mathbf{D}^{\prime}}$. Since $\bigcup_{k=1}^{m} \mathrm{U}_{k}^{\delta / 2}$ and $\mathrm{U}_{m+1}$ is a loose covering of D , it follows that the proposition is true for all finite coverings.

Now suppose the covering is infinite. By Prop. 2), § 4, if $|u|_{1, \mathrm{D}}=\infty$, i.e. $u \notin \check{\mathrm{P}}^{1}(\mathrm{D})$, then $\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathrm{D}}=\infty$; hence to prove the lemma we may assume that $|u|_{1, \mathrm{D}}<\infty$. By Lemma 1 we can decompose the covering of $\mathrm{D},\left\{\mathrm{U}_{k}\right\}=\bigcup_{i=1}^{q}\left\{\mathrm{U}_{k_{l}^{(i)}}\right\}$,
$q \leqslant p$, where for each $i\left\{\mathrm{U}_{k_{l}^{(i)}}\right\}$ is disjoint. Let

$$
\mathrm{U}_{(i)}=\bigcup_{l} \mathrm{U}_{\substack{i(i) \\ \hline i / 2}} ;
$$

then $\left\{\mathrm{U}_{k_{i}^{(i)}}\right\}$ is a $(\delta / 2)$-loose disjoint covering of $\mathrm{D}_{(i)}=\mathrm{D} \cap \mathrm{U}_{(i)}$. By Prop. 4), § 4, $\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathrm{D}_{(i)} \cap \mathrm{U}_{k_{l}}^{(i)}}=|u|_{1, \mathrm{D}_{(i)} \cap \mathrm{NU}_{k_{l}}^{(i)}}$ for $i=1, \ldots, q$ and all $l$. Then since

$$
\operatorname{dist}\left(\mathrm{U}_{k_{l}^{(i)}}^{\delta / 2} \cap \mathrm{D}_{(i)}, \quad \mathrm{D}_{(i)}-\mathrm{U}_{k_{l}}^{\delta /(i)}\right) \geqslant \delta / 2, \quad l=1,2, \ldots,
$$

we have that
$\limsup _{\alpha \uparrow 1}|u|_{\alpha, \mathbf{D}_{(i)}}^{2} \leqslant \limsup _{\alpha \uparrow 1}\left(\sum_{l}|u|_{\left.\alpha, \mathbf{D}_{(i)}\right) \mathrm{NU}_{k_{l}}^{(i)}}\right.$

$$
\left.+4 n(1-\alpha)\left(\frac{\hat{0}}{2}\right)^{-2 \alpha}|u|_{0, \mathrm{D}_{(i)}}^{2}\right)=\sum_{l}|u|_{1, \mathrm{D}_{(i)} \mathrm{n} \mathrm{U}_{k_{l}}^{(i)}}=|u|_{1, \mathrm{D}_{(i)}}^{2}
$$

since the infinite sum $\sum_{l}|u|_{\alpha, \mathrm{D}(i) \cap \mathrm{N}_{k_{i}}(i)}^{2}$ is dominated by

$$
\sum_{l} c|u|_{1, \mathrm{D} \cap \mathrm{~S}_{k_{l}}^{(i)}}^{2} \leqslant c|u|_{1, \mathrm{D}}^{2}<\infty
$$

Hence by Prop. 2), §4,

$$
\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathrm{D}^{(1)}}=\lim _{\alpha \uparrow \mathbf{1}}|u|_{\alpha, \mathbf{D}_{(i)}}=|u|_{1, \mathbf{D}_{(i)}}=|u|_{1, \mathrm{D} \cap U_{(i)}}
$$

Since $\left\{\mathrm{U}_{(\mathrm{i})}\right\}, i=1, \ldots, q$ is a finite loose covering of D which satisfies the hypotheses of the lemma the conclusion for infinite coverings follows from the previously considered finite case.

Proof of part b) of Prop. 1). - By the definition of the norm $|u|_{\alpha, \mathrm{D}}^{2}$ it is clearly sufficient to assume that $\alpha_{0}=1$. By Remark 3, §4, Prop. 1), § 2 and Prop. 8), § 4 it is easy to see that we need only consider $\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathrm{D}}$. By Prop. 2), §4, we may also assume that $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$.

Since $\mathrm{U}_{k}$ is a loose covering of $\mathrm{V}_{\mathrm{i}}^{\mathrm{j} / 8} \cap \mathrm{D}$ and

$$
\left.\mid \mathrm{U}_{k} \cap \mathrm{D} \cap\left(\partial \mathrm{~V}_{1}^{\hat{i} / 8} \cap \mathrm{D}\right)\right) \mid=0,
$$

we have by Props. 1), 4), and 6) of $\S 4$ and Prop. 8) of $\S 2$ that the hypotheses of Lemma 3 are satisfied with respect to $\mathrm{V}_{1}^{\mathrm{j} / 8} \cap \mathrm{D}$. Hence

Since $\operatorname{dist}\left(\mathrm{V}_{2}, \mathrm{R}^{n}-\mathrm{D}\right) \geqslant \delta / 8$ and $\left|\partial\left(\mathrm{V}_{2}^{\mathrm{z} / 8} \cap \mathrm{D}\right)\right|=0$, we have, by Lemma 1, § 1, Prop. 7), § 2, the continuity of $\left|\left.\right|_{\alpha, \mathrm{R}^{n}}\right.$ at $\alpha=1$, and by Prop. 4, § 4 that

$$
\lim _{\alpha \uparrow 1}|u|_{\alpha, \mathrm{D} \cap v_{i}^{\mathrm{i}} / 8}=|u|_{1, \mathrm{D} \cap n_{i}^{\mathrm{i}} / \mathrm{l}}^{1 / 8}<\infty .
$$

Since $\left\{V_{1}^{i / 8}, V_{2}^{\bar{z} / 8}\right\}$ is a loose covering of $D$ the proof of the proposition is completed by another application of Lemma 3.

Remarks about the spaces ${ }^{\text {P }}{ }^{\alpha, p}(\mathrm{D})$. - All the results of this section extend to the spaces ${ }_{\mathrm{P}}{ }^{\alpha, p}(\mathrm{D})$ (since all the statements of the preceding sections on which these results are based extend to ${ }_{\mathrm{P}}{ }^{\alpha, p}(\mathrm{D})$ ).

## 6. Density of $P^{\alpha}(D)$ in ${ }^{\check{\alpha}}(D)$ and graph type domains.

For an arbitrary domain $\mathrm{D}, \mathrm{P}^{\alpha}(\mathrm{D}) \subset \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and it is not always true that $\left.\mathrm{P}^{\alpha}(\mathrm{D})=\check{\mathrm{P}}^{\alpha}(\mathrm{D}){ }^{(23}\right)$. In the subsequent sec-
${ }^{\left({ }^{23}\right)}$ As a simple example consider the unit circle in $\mathrm{R}^{2}$ less the $x_{1}$-axis. Define $u(x)=0$ for $x_{2}<0$ and $=1$ for $x_{2}>0$. Then $u \in \check{\mathrm{P}}^{1}(\mathrm{D})$, but since $d_{\beta, \mathrm{D}}(u)=\infty$ for $\frac{1}{2} \leqslant \beta<1, u \notin \mathrm{P}^{1}(\mathrm{D})$.
tions we shall prove $\mathrm{P}^{\alpha}(\mathrm{D})=\mathrm{P}^{\alpha}(\mathrm{D})$ for a rather general class of domains which appears to give a very nearly complete description of domains where equality holds.

Although the question of equality is certainly the most important, a pertinent question is whether, in general, $\mathrm{P}^{\alpha}(\mathrm{D})$ is dense in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$. This may be answered in the negative. The most general class known for which $\check{\mathrm{P}}^{\alpha}(\mathrm{D})=\overline{\mathrm{P}^{\alpha}(\overline{\mathrm{D})}}$, the $\alpha$-density property, are the graph domains defined below. But first we show that density is a weakly localized boundary property.

Remark 1. - Since $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$ is dense in $\mathrm{P}^{\alpha}$, it follows by Theorem 1, § 2, that the $\alpha$-density property is equivalent to the fact that the restrictions to $D$ of functions in $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$ are dense in $\check{\mathrm{P}}^{\alpha}(\mathrm{D}) \cap \mathrm{C}^{\infty}(\mathrm{D}) \cap \mathscr{B}(\mathrm{D})$ in the norm of ${ }^{\text {P }} \alpha(\mathrm{D})(\mathscr{B}(\mathrm{D})$ is the class of functions in D with bounded support).

1) If $(\mathrm{P})$ is the " $\alpha$-density property» then $(\mathrm{P}) \equiv\left(\mathrm{P}_{w l}\right)$.

Proof. - Since $(\mathrm{P}) \succ\left(\mathrm{P}_{w l}\right)$ we need only show $\left(\mathrm{P}_{w l}\right) \succ(\mathrm{P})$. It is enough by Prop. 9), § 2, to prove that if D satisfies $\left(\mathrm{P}_{w l}\right)$ then $\mathrm{P}^{\alpha}(\mathrm{D})$ is dense in $\mathscr{\mathscr { O }}(\mathrm{D}) \cap \check{\mathrm{P}}^{\alpha}(\mathrm{D})$.

Let $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D}) \cap \mathscr{B}(\mathrm{D})$ and have support in $\mathrm{S}_{\mathrm{R}}=[|x|<\mathrm{R}]$. Since $\partial \mathrm{D} \cap \overline{\mathrm{S}_{\mathrm{R}+2}}$ is compact and D satisfies $\left(\mathrm{P}_{w l}\right)$ there is a covering of $\partial \mathrm{D} \cap \overline{\mathrm{S}_{\mathrm{R}+2}}$, say $\left\{\tilde{\mathrm{U}}_{k}\right\}, k=1, \ldots, \mathrm{~N}-1$, such that $\overline{\mathrm{P}^{\alpha}\left(\mathrm{D} \cap \tilde{\mathrm{U}}_{k}\right)}=\check{\mathrm{P}}^{\alpha}\left(\mathrm{D} \cap \tilde{\mathrm{U}}_{k}\right)$. Let

$$
\mathrm{U}_{k}=\tilde{\mathrm{U}}_{k} \cap \mathrm{~S}_{\mathrm{R}+2}, 2 \delta_{1}=\operatorname{dist}\left(\partial \mathrm{D} \cap \overline{\mathrm{~S}_{\mathrm{R}+1}}, \mathrm{R}^{n}-\bigcup_{k=1}^{\mathrm{Y}-1} \mathrm{U}_{k}\right)
$$

and define $\mathrm{U}_{\mathrm{s}}=\left(\mathrm{R}^{n}-\left(\partial \mathrm{D} \cap \mathrm{S}_{\mathrm{R}+1}\right)\right)^{\delta_{1}}$. Then $\left\{\mathrm{U}_{k}\right\}, k=1, \ldots, \mathrm{~N}$, is a $\delta$-loose covering of $\overline{\mathrm{D}}$, for some $\hat{\delta}$ with $0<\delta \leqslant \delta_{1}$.

Let $\left\{\psi_{k}\right\}$ be the partition of unity given in Lemma $2, § 5$, corresponding to the covering $\left\{\mathrm{U}_{k}\right\}$. Then $\oint_{k} u$ has support in $\mathrm{U}_{k}^{\delta / 3} \cap \mathrm{D}, k=1, \ldots, \mathrm{~N}$, and by Prop. 6), §2, $\stackrel{\vartheta}{k} u \in \stackrel{\check{\mathrm{P}}}{ }^{\alpha}(\mathrm{D})$ a fortiori $\psi_{k} u \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{D} \cap \tilde{\mathrm{U}}_{k}\right)$.

Now, given $\varepsilon>0$, let $u_{k} \in \mathrm{P}^{\alpha}, k=1, \ldots, \mathrm{~N}-1$, be such that

$$
\begin{aligned}
\left|u_{k}-\varphi_{k} u\right|_{\alpha, \mathrm{DnU}}^{k}
\end{aligned} \leqslant\left|u_{k}-\varphi_{k} u\right|_{\alpha, \mathrm{D} \cap \tilde{\mathrm{v}}_{k}} .
$$

where $m=[\alpha]$ and $\beta=\alpha-m$. We may assume $u_{k}$ has support in $\mathrm{U}_{k}^{\delta / 6}\left({ }^{24}\right)$. Therefore it is easy to see by (2.7) that

$$
\begin{align*}
\left|u_{k}-\varphi_{k} u\right|_{\alpha, \mathrm{D}}^{2} \leqslant & \left|u_{k}-\Psi_{k} u\right|_{\alpha, \mathrm{D} \cap \mathrm{D}_{k}}^{2}  \tag{6.1}\\
+ & \frac{2}{\mathrm{C}(n, \beta)} \sum_{l=0}^{m}\binom{m}{l} \sum_{|i|=l} \int_{\mathbf{D}_{\mathrm{N}}, k}\left|\mathrm{D}_{i}\left(u_{k}(x)-\Psi_{k} u(x)\right)\right|^{2} \\
& \quad \int_{|x-y|>\delta / 6}|x-y|^{-n-2 \beta} d x d y \\
\leqslant & \left(1+2 n\left(\frac{\delta}{6}\right)^{-2 \beta}\right)\left|u_{k}-\Psi_{k} u\right|_{\alpha, \mathrm{D} \cap \mathrm{U}_{k}}^{2}<\varepsilon^{2} /(\mathrm{N}-1)^{2}
\end{align*}
$$

(the second term in each inequality is omitted if $\beta=0$ ).
Since $\operatorname{dist}\left(\mathrm{R}^{n}-\mathrm{D}, \mathrm{S}_{\mathrm{R}} \cap \mathrm{U}_{\mathrm{N}}^{\dot{\delta} / 3}\right) \geqslant \delta_{1}, \psi_{\mathrm{N}} u$ has support in $\mathrm{D}^{\grave{\omega}_{1}}$. Hence $\varphi_{\mathrm{N}} u$, when extended by 0 outside D , is in $\mathrm{P}^{\alpha}$ (cf. Prop. 7), § 2). $\quad \mathrm{v}-1$

Thus $u^{\prime}=\varphi_{\mathrm{N}} u+\sum_{k=1}^{\mathrm{N}-1} u_{k}$ is in $\mathrm{P}^{\alpha}$ and
$\left|u-u^{\prime}\right|_{\alpha, \mathrm{D}}=\left|\sum_{k=1}^{\mathbf{N}}\left(\varphi_{k} u\right)-\varphi_{\mathrm{v}} u-\sum_{k=1}^{\mathrm{N}-1} u_{k}\right|_{\alpha, \mathrm{D}} \leqslant \sum_{k=1}^{\mathrm{N}-1}\left|\vartheta_{k} u-u_{k}\right|_{\alpha, \mathrm{D}}<\varepsilon$
which completes the proof.
2) If D satisfies the $\alpha$-density property and $\mathrm{T}^{-1}$ is a $\mathrm{C}^{(k, 1)-}$ homeomorphism, $k \geqslant \alpha^{*}$, defined on the open set $\mathrm{U}, \mathrm{U} \supset \overline{\mathrm{D}}$, then $\mathrm{D}^{*}=\mathrm{T}^{-1}(\mathrm{D})$ satisfies the $\alpha$-density property.

Proof. - By Prop. 9), §2, we need only prove that $\mathrm{P}^{\alpha}\left(\mathrm{D}^{*}\right)$ is dense in $\check{P}^{\alpha}\left(\mathrm{D}^{*}\right) \cap \mathscr{B}\left(\mathrm{D}^{*}\right)$.

Let $u^{*} \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{D}^{*}\right) \cap \mathscr{B}\left(\mathrm{D}^{*}\right)$ and $\varepsilon>0$ be given. By Prop. 8), $\S 2, u(x)=u^{*}\left(\mathrm{~T}^{-1} x\right) \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and clearly $u$ has bounded support. By hypothesis there is a $\varphi \in \mathrm{P}^{\alpha}$ such that

$$
|u-v|_{\alpha, \mathrm{D}}<\varepsilon / \mathrm{CM}^{\alpha+3 n / 2}
$$

where C is the constant given in Prop. 8 ), $\S 2$, and M is the common Lipschitz constant of $T$ and $\mathrm{T}^{-1}$. Since $u$ has bounded support it is clear that we may suppose that the support $S$ ( $\mathrm{S}=[x: \varphi(x) \neq 0]$ ) of $v$ is bounded. Since $\overline{\mathrm{D}^{*} \cap \mathrm{~T}^{-1}(\mathrm{~S})}$ is compact, $\operatorname{dist}\left(\mathrm{R}^{n}-\mathrm{T}^{-1}(\mathrm{U}), \mathrm{D}^{*} \cap \mathrm{~T}^{-1}(\mathrm{~S})\right)=2 \delta>0$. Let $\varphi$ be
$\left.{ }^{24}\right)$ Let $\varphi \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right)=1$ on $\mathrm{U}_{k i}^{\delta / 3}$ and $=0$ outside $\mathrm{U}_{k}^{\delta / 6}$ (cf. Lemma 1,§1); then $\varphi u_{k}$ has support in $\mathrm{U}_{k}^{\delta / 6}$ and we may replace $u_{k}$ by $\varphi u_{k}$ by applying Prop. 6), §2, and noting that $\varphi u_{k}-\varphi_{k} u=\varphi\left(u_{k}-\varphi_{k} u\right)$.
the function given in Lemma 1, § 1, which vanishes outside $\left(\mathrm{T}^{-1}(\mathrm{U})\right)^{\delta / 2}$ and $=1$ on $\overline{\mathrm{D} \cap \mathrm{T}(\mathrm{S})}$. Then

$$
\rho^{*}\left(x^{*}\right)=\varphi\left(x^{*}\right) \varphi\left(\mathrm{T} x^{*}\right)=\varphi\left(\mathrm{T} x^{*}\right) \quad \text { for } \quad x \in \mathrm{D}^{*}
$$

and by Prop. 7), § 2, $\varsigma^{*}$ when extended by 0 outside ( $\left.\mathrm{T}^{-1}(\mathrm{U})\right)^{\delta / 2}$ is in $\mathrm{P}^{\alpha}$. Furthermore, by Prop. 6), § 2,

$$
\left|u^{*}-\varsigma^{*}\right|_{\alpha, \mathrm{D}^{*}} \leqslant c|u-\varphi|_{\alpha, \mathbf{D}}<\varepsilon .
$$

D is a simple graph domain, for brevity an SG-domain, if $D=J(\tilde{D})$ where $J$ is an isometry of $R^{n}$ and $\tilde{D}$ is of the following type. Let $\tilde{\mathrm{B}} \subset \mathrm{R}^{n-1}$ be a rectangle and $\tilde{f}$ a continuous function on $\overline{\mathrm{B}}$ with a positive lower bound, then

$$
\tilde{\mathrm{D}}=\left[\left(x^{\prime}, x_{n}\right): x^{\prime} \in \tilde{\mathrm{B}}, 0<x_{n}<\tilde{f}\left(x^{\prime}\right)\right] .
$$

$\mathrm{B}=\mathrm{J}(\tilde{\mathrm{B}})$ is the basis of D and $f(x)=\tilde{f}\left(\mathrm{~J}^{\mathbf{- 1}}(x)\right)$ for $x \in \overline{\mathrm{~B}}$ is the graph function of $D$.

D is a graph domain, for brevity a G-domain, if D satisfies the property ( D is an SG-domain) $)_{w l}$.
3) If D is an SG -domain then D satisfies the $\alpha$-density property for all $\alpha$.

Proof. - By Prop. 9), § 2 and Theorem I, § 2, it is sufficient to show that $\mathrm{P}^{\alpha}(\mathrm{D})$ is dense in $\check{\mathrm{P}}^{\alpha}(\mathrm{D}) \cap \mathscr{B}(\mathrm{D}) \cap \mathrm{C}^{\infty}(\mathrm{D})$ and clearly we may assume that $\mathrm{D}=\left[\left(x^{\prime}, x_{n}\right): 0<x_{n}<f\left(x^{\prime}\right), x^{\prime} \in \mathrm{B}\right]$.

Let $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D}) \cap \mathscr{B}(\mathrm{D}) \cap \mathrm{C}^{\infty}(\mathrm{D})$ and $2 \grave{\delta}=\min _{x^{\prime} \in \overline{\mathrm{B}}} f\left(x^{\prime}\right)(>0)$. For $t \geqslant 0$ let $\mathrm{D}_{t}=\left[\left(x^{\prime}, x_{n}\right): 0<x_{n}<f\left(x^{\prime}\right)+t, x^{\prime} \in \mathrm{B}\right],\left\{h_{\mu}\right\}$, $\mu=0,1, \ldots, \alpha^{*}$, a strictly increasing sequence of positive numbers and $\tilde{u}$ the Lichtenstein extension of order $\alpha^{*}$ of $u$ given in (3.3). By Prop. 3), §3, $\tilde{u} \in \check{\mathrm{P}}^{\alpha}(\tilde{\mathbf{D}})$ and $\left.\left.\mid \tilde{u}\right\rceil_{\alpha, \tilde{\mathrm{D}}} \leqslant c \mid u\right\rceil_{\alpha, \mathbf{D}}$ where $c$ depends only on $n$ and $\alpha^{*}$. For $0 \leqslant t<\delta h_{\alpha *}^{-1}$ define

$$
u_{t}(x)=\tilde{u}\left(x^{\prime}, x_{n}-t\right), \quad x \in \mathrm{D}_{t} .
$$

Hence $u_{t} \in$ ̌ $^{\alpha}\left(\mathrm{D}_{t}\right)$ and $\left.\left.\left.\left.\mid u\right\rceil_{\alpha, \mathrm{D}} \leqslant \mid u_{t}\right\rceil_{\alpha, \mathrm{D}} \leqslant \mid \tilde{u}\right\rceil_{\alpha, \tilde{\mathrm{D}}} \leqslant c \mid u\right\rceil_{\alpha, \mathrm{D}}$.
For $t \downarrow 0$ the functions $u_{\imath}$ are uniformly bounded in norm in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$. Therefore by a well known theorem from Hilbert space theory there is a sequence $\left\{u_{t_{k}}\right\}$ converging weakly in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and a subsequence of $\left\{u_{t\}}\right\}$ whose arithmetic means
converge strongly in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$. These aritmetic means must converge to $u$ since they converge pointwise to $u\left(u \in \mathrm{C}^{\infty}(\mathrm{D})\right)$.

Therefore given $\varepsilon>0$ there exists $\varphi \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{D}_{\bar{t}}\right), \bar{t}>0$, such that $\mid u-\varphi\rceil_{\alpha, \mathbf{D}}<\varepsilon$. Let $\mathrm{C}=\left[\left(x^{\prime}, x_{n}\right): x^{\prime} \in \mathrm{B}, x_{n}>0\right]$, a rectangle, and $\mathrm{V}=\left[x \in \mathrm{D}_{t}: v(x) \neq 0\right]$. Since $u$ has a bounded support the same is true for $\varphi$ (by the above construction). Hence $\overline{\mathrm{V}}$ is compact and $2 \delta_{1}=\operatorname{dist}\left(\overline{\mathrm{V}} \cap \overline{\mathrm{D}}, \quad \overline{\mathrm{C}}-\overline{\mathrm{D}}_{t}\right)>0$. Let $\varphi$ be the function in $\mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right)$ given in Lemma $1, \S 1$, such that $\varphi=1$ on $\overline{\mathrm{D}} \cap \overline{\mathrm{V}}$ and $=0$ outside a $\bar{\delta}_{1}$-neighborhood of $\overline{\mathrm{D}} \cap \overline{\mathrm{V}}$. It is easy to see that $\mathscr{\varphi} \varphi \in \mathrm{P}_{\text {loc }}^{\alpha}(\mathrm{C})$ (extended by 0 in $C-D_{t}$ ) and by a calculation similar to (6.1) and Prop. 6), § 2, that

$$
\left.\left|\zeta \rho 7_{\alpha, \mathrm{C}}^{2} \leqslant\left(1+4 n \hat{\delta}_{1}^{-2 \beta}\right)\right| \varphi \varphi\right\rangle_{\alpha, \mathbf{D}_{t}}^{2} \leqslant c\left(1+4 n \hat{\delta}_{1}^{-2 \beta}\right)|\varphi|_{\alpha, \mathbf{D}_{t}}^{2}
$$

where $\beta=\alpha-[\alpha]$ and $c$ depends only on $\delta_{1}, \alpha^{*}$, and $n$. Hence $\psi \varphi \in \check{\mathrm{P}}^{\alpha}(\mathrm{C})$. By Prop. $\left.2^{\prime}\right), \S 3, \psi \varphi \in \mathrm{P}^{\alpha}(\mathrm{C})$ and it is clear that $|\psi-u-u\rangle_{\alpha, \mathrm{D}}=|\varphi-u\rangle_{\alpha, \mathrm{D}}<\varepsilon$ which completes the proof.
4) If D is a G -domain then D satisfies the $\alpha$-density property for any $\alpha$.

Proof. - Propositions 1) and 3).
5) If D is L -convex then D satisfies the $\alpha$-density property for $0 \leqslant \alpha \leqslant 1$.

The proof follows from Propositions 1), 2) and 4) and the fact that a convex set is a G-domain.

Remarks on spaces $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D})$. - For $1<p<\infty$ all the theorems of this section can be extended with some slight changes in proofs (where we used the Hilbert space structure of ${ }^{\mathrm{P}} \alpha(\mathrm{D})$ ). The problem of density of $\mathrm{P}^{\alpha}(\mathrm{D})$ in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ is replaced here by the one of density of $\left.\check{\mathrm{P}}^{\alpha, p}\left(\left.\mathrm{R}^{n}\right|_{\mathrm{D}}\right){ }^{(25}\right)$ in $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D})$. As concerns the spaces $\check{\mathrm{P}}^{\alpha, 1}(\mathrm{D})$ and $\check{\mathrm{P}}^{\alpha, \infty}(\mathrm{D})$ the following remarks can be made.

The spaces ${ }_{\mathrm{P}}{ }^{\alpha, 1}(\mathrm{D})$ are defined for all $\alpha \geqslant 0$ except for the integers $\alpha \geqslant 2$. In the exceptional cases we can replace $\check{\mathrm{P}}^{\alpha, 1}(\mathrm{D})$ by $\mathrm{W}_{1}^{\alpha}(\mathrm{D})$ the imperfect completions rel. $\mathfrak{A}_{0}$ (or by the "almost" perfect completions as in [2]). The theorems of
( $\left.{ }^{25}\right) \check{\mathrm{P}}^{\alpha, p}\left(\left.\mathrm{R}^{n}\right|_{\mathrm{D}}\right)$ is the class of restrictions of functions in $\check{\mathrm{P}}^{\alpha, p}\left(\mathrm{R}^{n}\right)$ to D .
the present section can still be extended with more drastic changes in proofs due to the fact that ${ }^{\alpha, 1}(\mathrm{D})$ are not reflexive.

The spaces $\check{\mathrm{P}}^{\alpha, \infty}(\mathrm{D})$ are proper functional spaces for

$$
\alpha>0\left(\check{\mathrm{P}}^{0, \infty}(\mathrm{D})=\mathrm{L}^{\infty}(\mathrm{D})\right) .
$$

Their norms are obtained by the usual limit procedure from the norms in ${ }^{\chi} \alpha, p(D)$ for $p \uparrow \infty$. We have (putting as usual $m=[\alpha], \quad \beta=\alpha-m)$
(6.2) $|u|_{\alpha, \infty, \mathbf{D}}=\max _{|i| \leqslant m}\left[\sup _{x \in \mathbf{D}}\left|\mathrm{D}_{i} u(x)\right|, \sup _{x, y \in \mathbf{D}} \frac{\left|\mathrm{D}_{i} u(x)-\mathrm{D}_{i} u(y)\right|}{|x-y|^{\beta}}\right]$.
(When $\alpha$ is an integer we omit the second sup in the square bracket).

For $\check{\mathrm{P}}^{\alpha, \infty}(\mathrm{D})$ all the propositions of the present section are in general false. Some of them become true under suitable restrictions on D. For instance Propositions 1) and 2) are true for D bounded. Proposition 2) is true even for D unbounded as long as $\mathrm{D} \subset \mathrm{U}^{\grave{ }}$ for some $\delta>0$.

## 7. Localization of extension theorems.

The statement $\mathrm{P}^{\alpha}(\mathrm{D})=\mathrm{P}^{\alpha}(\mathrm{D})$ is equivalent to the assertion that for every $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ there exists a $\tilde{u} \in \mathrm{P}^{\alpha}$ such that $u(x)=\tilde{u}(x)$ in D . Since $\mathrm{P}^{\alpha}$, as well as $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ are Hilbert spaces the preceding statement is equivalent to the fact that there exists a linear bounded extension mapping of $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ into $\mathrm{P}^{\alpha}$. In Prop. 2), §3, we have given such a mapping when $D$ is a rectangle.

This linear mapping is clearly not unique but there does exist a distinguished mapping, viz. the mapping with minimum bound. This mapping is not in general easy to construct explicitly.

We now introduce the following notation. Let $\mathrm{I} \subset[0, \infty)$ be an interval and $\Gamma \equiv \Gamma\left(\mathrm{I}^{\prime}\right) \geqslant 1$ be a finite valued increasing function defined on the compact subintervals $I^{\prime}$ of $I$. Then we write $\mathrm{D} \in \mathcal{E}(\mathrm{I}, \Gamma)$ if there is a linear mapping E with domain $\mathscr{D}_{\mathrm{E}} \subset \mathfrak{M r}(\mathrm{D})$ and range $\mathfrak{M r}\left(\mathrm{R}^{n}\right)$ such that
(7.1a) $\quad \mathrm{Eu}$ is an extension of $u$ for $u \in \mathscr{D}_{\mathrm{E}}$
and
(7.1b) if $\alpha \in \mathrm{I}$ then $\check{\mathrm{P}}^{\alpha}(\mathrm{D}) \subset \mathscr{D}_{\mathrm{E}}, \quad \mathrm{E}\left(\check{\mathrm{P}}^{\alpha}(\mathrm{D})\right) \subset \mathrm{P}^{\alpha}$
and for any compact subinterval $I^{\prime}$ of $I$ and $\alpha \in I^{\prime}$,

$$
\begin{equation*}
|\mathrm{E}|_{\mathbf{P}^{\alpha}, \check{P}^{\alpha}(\mathbf{D})} \leqslant \Gamma\left(\mathrm{I}^{\prime}\right) \tag{7.1c}
\end{equation*}
$$

We shall write $\mathrm{D} \in \mathcal{E}(\mathrm{I})\left({ }^{26}\right)$ if $\mathrm{D} \in \mathscr{E}(\mathrm{I}, \Gamma)$ for some $\Gamma$.
We note that if $D \in \mathscr{E}(\mathrm{I})$ then $\check{\mathrm{P}}^{\alpha}(\mathrm{D})=\mathrm{P}^{\alpha}(\mathrm{D})$ for $\alpha \in \mathrm{I}$. In Prop. 2), §3 we have proved that if D is a rectangle then $\mathrm{D} \in \mathscr{E}([0, q])$ for any positive integer $q$.

Theorem I. - Let T be a homeomorphism of class $\mathrm{C}^{(q, 1)}$ with Lipschitz constant M of the open set U onto $\mathrm{U}^{*}$ and let $\mathrm{D} \subset \mathrm{U}^{\delta}$. If $\mathrm{D} \in \mathscr{E}(\mathrm{I}, \Gamma), \mathrm{I} \subset[0, q+1]$ then $\mathrm{D}^{*}=\mathrm{T}(\mathrm{D}) \in \mathcal{E}\left(\mathrm{I}, \Gamma^{*}\right)$ where $\Gamma^{*}\left(\mathrm{I}^{\prime}\right)=c \mathrm{M}^{2 q+3(n+1)} \delta^{-1} \Gamma\left(\mathrm{I}^{\prime}\right)$ and $c$ depends only on $n$ and $q$.

Proof. - Let E be the extension mapping which satisfies (7.1). If $u^{*} \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{D}^{*}\right), \alpha \in \mathrm{I}$, then $u(x)=u^{*}(\mathrm{~T} x) \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ by Prop. 8), § 2 and $\tilde{u}(x)=\mathrm{Eu}(x) \in \mathrm{P}^{\alpha}$. Let $\oplus \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right)$ be the function which $=1$ on D and $=0$ outside $\mathrm{U}^{\delta / 2}$ given in Lemma 1, § 1. Then by Prop. 7), §2, $\varphi(x) u(x) \in \mathrm{P}^{\alpha}\left(=\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)\right)$ and by Prop. 8), § $2, \tilde{u}^{*}\left(x^{*}\right)=¢\left(\mathrm{~T}^{-1} x^{*}\right) \tilde{u}\left(\mathrm{~T}^{-1} x^{*}\right) \in \mathrm{P}^{\alpha}\left(\mathrm{U}^{*}\right)$. Since $\tilde{u}^{*}\left(x^{*}\right)=u^{*}\left(x^{*}\right)$ for $x^{*} \in \mathrm{D}^{*}$ and $\tilde{u}^{*}$ vanishes outside $\left(\mathrm{U}^{*}\right)^{\delta / 2 \mathrm{~m}}$, it is easily seen (cf. Prop. 7, §2) that $\tilde{u}^{*} \in \mathrm{P}^{\alpha}$ (extended by 0 outside $\mathrm{U}^{*}$ ) and from the quoted propositions that

$$
\mathrm{E}^{*} u^{*}=\tilde{u}^{*}
$$

satisfies (7.1) with $\Gamma$ replaced by $\Gamma^{*}$.
Theorem II. - Let property ( P ) be « $\mathrm{D} \in \mathcal{E}(\mathrm{I}, \Gamma) »$. If D satisfies $\left(\mathrm{P}_{s l, \delta, p}\right)$ (with $\delta \leqslant 1$ ) then $\mathrm{D} \in \mathcal{E}\left(\mathrm{I}, \Gamma^{*}\right)$ where

$$
\Gamma^{*}\left(\mathrm{I}^{\prime}\right)=\Gamma^{*}\left(\left[\alpha_{1}, \alpha_{2}\right]\right)=c_{0} \grave{\delta}^{-\alpha_{2}} \Gamma\left(\mathrm{I}^{\prime}\right)
$$

and $c_{0}$ depends only on $p, n$, and $\alpha_{2}^{*}$.
Proof. - Let $\left\{\mathrm{U}_{k}\right\}$ be the $\delta$-loose covering with rank $p$ of $\partial \mathrm{D}$ such that $\mathrm{D} \cap \mathrm{U}_{k} \in \mathcal{E}(\mathrm{I}, \Gamma)$ and $\mathrm{E}_{k}$ the corresponding extension mapping which satisfies (7.1).

[^4]Let $\left\{\psi_{k}\right\}$ be the partition of unity corresponding to $\left\{\mathrm{U}_{k}\right\}$ and $\partial \mathrm{D}$ given in Lemma $2, \S 5$. Then $\left(1-\sum_{k=1}^{\infty} \psi_{k}(x)\right) \in \mathrm{C}^{\infty},=0$ in $\mathrm{S}(\partial \mathrm{D}, \delta / 8)$ and $=1$ outside of $\mathrm{S}(\partial \mathrm{D}, \delta / 4)$ and

$$
\left|\mathrm{D}_{i}\left(1-\sum_{k=1}^{\infty} \psi_{k}(x)\right)\right| \leqslant \mathrm{C}_{i i j} j^{-|i|}
$$

where $\mathrm{C}_{i i \mid}$ depends only on $p,|i|$ and $n$. We construct now an extension mapping E for D . We define

$$
\mathscr{D}_{\mathrm{E}}=\left\{u: u \in \mathbb{M}(\mathrm{D}) \quad \text { and }\left.\quad u\right|_{\mathrm{U}_{k} \cap \mathrm{D}} \in \mathscr{D}_{\mathrm{F}_{k} k}\right\}\left({ }^{27}\right) ;
$$

it is obviously a linear class of functions. We put then for $u \in \mathscr{D}_{\mathrm{E}}$

$$
\begin{equation*}
\tilde{u}=\mathrm{E} u=\sum_{k=1}^{\infty} \psi_{k} \mathrm{E}_{k} u_{k}(x)+\mathrm{E}_{0} u(x) \tag{7.2}
\end{equation*}
$$

where $\mathrm{E}_{0} u(x)=\left(1-\sum_{k=1}^{\infty} \psi_{k}\right) u(x)$ for $x \in \mathrm{D}$ and $=0$ for $x \notin \mathrm{D}$. Obviously condition $(7.1 a)$ is satisfied. Suppose now, $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$, $\alpha \in I^{\prime} \subset I, I^{\prime}=\left[\alpha_{1}, \alpha_{2}\right]$. Then by Prop. 6), § 2,

$$
\left.\left|\psi_{k} \mathrm{E}_{k} u_{k}\right|_{\alpha, \mathrm{B}^{n}} \leqslant c \delta^{-\left[\alpha_{\alpha}\right]}\right]\left(\mathrm{I}^{\prime}\right)|u|_{\alpha, \mathrm{DnU}}
$$

and by Prop. 7), § $2,\left|\mathrm{E}_{0} u\right|_{\alpha, \mathrm{R}^{\mathrm{n}}} \leqslant c \delta^{-\left[\alpha_{\alpha}\right]}|u|_{\alpha, \mathrm{D}}$ where $c$ depends only on $p, n$, and $\alpha_{2}^{*}$, and clearly can be chosen to depend increasingly on $\left[\alpha_{2}\right]$. Therefore

$$
\begin{aligned}
|\tilde{u}|_{\alpha, \mathrm{R}^{n}}^{2} & \leqslant 2\left|\sum_{k=1}^{\infty} \psi_{k} \mathrm{E}_{k} u_{k}\right|_{\alpha, \mathrm{R}^{n}}^{2}+2\left|\mathrm{E}_{0} u\right|_{\alpha, \mathrm{R}^{n}}^{2} \\
& \leqslant 4 p \sum_{k=1}\left|\psi_{k} \mathrm{E}_{k} u_{k}\right|_{\alpha, \mathrm{R}^{n}}^{2}+2\left|\mathrm{E}_{0} u\right|_{\alpha, \mathrm{R}^{n}}^{2} \\
& \leqslant 4 c^{2} p \delta^{-2\left[\alpha_{3}\right]} \Gamma\left(\mathrm{I}^{\prime}\right)^{2} \sum_{k=1}^{\infty}|u|_{\alpha, \mathrm{Dn}}^{2} \\
& \left.\leqslant c^{2} \delta^{-2\left[\alpha_{2}\right.}\left(4 c^{2} \delta^{-2\left[\alpha \alpha_{3}\right]}|u|_{\alpha, \mathrm{D}}^{2} \Gamma \mathrm{I}^{\prime}\right)^{2}+2\right)|u|_{\alpha, \mathrm{D}}^{2},
\end{aligned}
$$

which completes the proof (we put $c_{0}=3 p c$ ).
Remarks about the spaces ${ }^{\text {P }}{ }^{\alpha, p}(\mathrm{D})$. - For $p \neq 2$ the extension mappings should transform $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D})$ into $\check{\mathrm{P}}^{\alpha, p}\left(\mathrm{R}^{n}\right)$. Since now we deal with Banach spaces which are not Hilbert spaces, the fact that each $u \in \check{\mathrm{P}}^{\alpha, p}(\mathrm{D})$ can be extended to $\tilde{u} \in \check{\mathrm{P}}^{\alpha, p}\left(\mathrm{R}^{n}\right)$
$\left({ }^{27}\right)$ The symbol $\left.u\right|_{F}$ means the restriction of $u$ to $F$.
does not automatically imply that there exists a bounded linear extension mapping.

We introduce the classes $\mathscr{E}^{\mathscr{P}}(\mathrm{I}, \Gamma)$ in a similar way as $\mathscr{E}(\mathrm{I}, \Gamma)$ by replacing $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and $\mathrm{P}^{\alpha}$ by $\mathrm{P}^{\alpha, p}(\mathrm{D})$ and $\mathrm{P}^{\alpha, p}\left(\mathrm{R}^{n}\right)$ in the definition. The theorems of this section are then immediately extended to $p \neq 2$ since all the results on which they are based have corresponding extensions. The preceding statement holds even for $p=1$ and $p=\infty$.

## 8. Regularized distance, simple Lipschitzian graph domains and singular multipliers.

In this section we shall develop some notions for later use. We start by a well-known theorem of H . Whitney. Our proof is much shorter than other published proofs. Let $\mathrm{F} \subset \mathrm{R}^{n}$ be an arbitrary non-empty set and

$$
r_{\mathrm{F}}(x)=\operatorname{dist}(x, \mathrm{~F}) .
$$

Theorem I. - For arbitrary $\varepsilon, 0<\varepsilon<1$, there exists a function $\rho(x) \equiv \rho_{\mathrm{F}, \varepsilon}(x)$ defined on $\mathrm{R}^{n}$ such that:
i) $(1-\varepsilon) r_{\mathrm{F}}(x) \leqslant \rho(x) \leqslant r_{\mathbf{F}}(x), x \in \mathrm{R}^{n}$,
ii) $\rho \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}-\overline{\mathrm{F}}\right)$ and

$$
\left|\mathrm{D}_{i \mathrm{P}}(x)\right| \leqslant r_{\mathrm{F}}(x)^{1-|i| \varepsilon-|i|} \mathrm{B}_{[i i}, \quad x \in \mathrm{R}^{n}-\overline{\mathrm{F}},
$$

where $\mathrm{B}_{|i|}$ depends only on $|i|$ and $n$.
Proof. - Let $e(x) \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right)$ be a fixed decreasing function of $|x|$ which vanishes for $|x| \geqslant 1$ and such that

$$
\int e(x) d x=1 .
$$

Then we define

$$
\rho(x)= \begin{cases}c^{-n} \frac{(1-c)^{n}}{(1+c)^{n-1}} \int r_{\mathrm{F}}(y)^{1-n} e\left(\frac{x-y}{c r_{\mathrm{F}}(y)}\right) d y, & x \in \mathrm{R}^{n}-\overline{\mathrm{F}},  \tag{8.1}\\ 0, & x \in \overline{\mathrm{~F}},\end{cases}
$$

where $c=\varepsilon /(4 n-2)$.

For $x \in \overline{\mathrm{~F}}$, part i) is trivial. With $r(y) \equiv r_{\mathrm{F}}(y)$ we have for $x$ and $y$ satisfying $|x-y|<\operatorname{cr}(y)$ :
(8.1a) $\quad r(x) \leqslant r(y)+|x-y|<(1+c) r(y)$, $r(x) \geqslant r(y)-|x-y|>(1-c) r(y)$,
(8.1b) for $x \in \mathrm{~S}\left(x_{0}, \frac{1}{2} r\left(x_{0}\right)\right)\left(x_{0} \boxminus \overline{\mathrm{~F}}\right)$,

$$
r(y)>(1+c)^{-1} r(x)>\frac{1}{2(1+c)} r\left(x_{0}\right)>0
$$

From the monotonicity of $e(x)$ in $|x|$ and (7.1a) we obtain for $x \in \mathrm{R}^{n}-\overline{\mathrm{F}}$

$$
\rho(x) \leqslant r(x)\left(\frac{c r(x)}{1-c}\right)^{-n} \int e\left(\frac{x-y}{\frac{c}{1-c} r(x)}\right) d y=r(x)
$$

and

$$
\begin{aligned}
& \rho(x) \geqslant r(x)\left(\frac{c r(x)}{1+c}\right)^{-n}\left(\frac{1-c}{1+c}\right)^{2 n-1} \int e\left(\frac{x-y}{\frac{c}{1+c} r(x)}\right) d y \\
&=r(x)\left(\frac{1-c}{1+c}\right)^{2 n-1}
\end{aligned}
$$

and $i$ ) is clear from the choice of $c$.
That $p \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}-\overline{\mathrm{F}}\right)$ is clear from (8.1b) and from (8.1a),

$$
\begin{aligned}
&\left|\mathrm{D}_{i \rho} \rho(x)\right| \leqslant c^{-n-|i|} \frac{(1-c)^{n}}{(1+c)^{n-1}} \int r(y)^{1-|i|-n}\left|\left(\mathrm{D}_{i} e\right)\left(\frac{x-y}{c r(y)}\right)\right| d y \\
& \leqslant r(x)^{1-|i|}\left(\frac{c}{1+c}\right)^{-|i|} \frac{\omega_{n}}{n} \sup _{z \in \mathrm{R}^{n}}\left|\mathrm{D}_{i} e(z)\right|
\end{aligned}
$$

and ii) follows.
A domain D is a simple Lipschitzian graph domain with constant M, for brevity, an SLG-domain, if D is an SG-domain and the graph function $f$ is Lipschitzian with Lipschitz constant M.

Theorem II. - Let $\mathrm{D}=\left[\left(x^{\prime}, x_{n}\right): 0<x_{n}<f\left(x^{\prime}\right), x^{\prime} \in \mathrm{R}^{n-1}\right]$ be an SLG-domain with constant M and basis $\mathrm{B}=\mathrm{R}^{n-1}$. Put $\mathrm{D}_{+}=\left[\left(x^{\prime}, x_{n}\right): f\left(x^{\prime}\right)<x_{n}, x^{\prime} \in \mathrm{R}^{n-1}\right]$. Then for arbitrary $\varepsilon$, $0<\varepsilon<1$, there is a function $\rho(x) \equiv \rho_{\mathrm{D}, \varepsilon}(x)$ defined on $\mathrm{D}_{+}$ which satisfies:
i) $(1-\varepsilon)\left(x_{n}-f\left(x^{\prime}\right)\right) \leqslant p(x) \leqslant\left(x_{n}-f\left(x^{\prime}\right)\right)$,
ii) $\rho \in \mathrm{C}^{\infty}\left(\mathrm{D}_{+}\right)$and $\left|\mathrm{D}_{i \mathrm{P}} \rho(x)\right| \leqslant\left(x_{n}-f\left(x^{\prime}\right)\right)^{1-|i|} \mathrm{M}_{0}^{|i|} \varepsilon^{-1 i} \mathrm{~B}_{|i|}$ where $\mathrm{M}_{0}=\max (\mathrm{M}, 1)$ and $\mathrm{B}_{|i|}$ depends only on $|i|$ and $n$,
iii) $\frac{\partial \rho}{\partial x_{n}}(x)>(1-\varepsilon)$.

Remark 1. - Since for $x \in \mathrm{D}_{+}$,

$$
r_{\mathrm{D}}(x) \leqslant x_{n}-f\left(x^{\prime}\right) \leqslant\left(1+\mathrm{M}^{2}\right)^{1 / 2} r_{\mathrm{D}}(x)
$$

we can replace $x_{n}-f\left(x^{\prime}\right)$ in the lower bound of i) by $r_{\mathrm{D}}(x)$ and in the upper bound by $2 \mathrm{M}_{0} r_{\mathrm{D}}(x)$. In ii) we may replace $\left(x_{n}-f\left(x^{\prime}\right)\right)^{1-i \mid}$ by $\rho(x)^{1-i \mid}$ or $r_{\mathrm{D}}(x)^{1-|i|}$.

Proof of Theorem II. - Without loss of generality we will assume that $\mathrm{M} \geqslant 1$, hence $\mathrm{M}_{0}=\mathrm{M}$.

Let $e \in \mathrm{C}_{0}^{\infty}[0, \infty)$ be a decreasing function which is constant in a neighborhood of 0 , vanishes for $r \geqslant 1$ and such that

$$
\int_{\mathbf{R}^{n-1}} e\left(\left|z^{\prime}\right|\right) d z^{\prime}=\omega_{n-1} \int_{0}^{\infty} e(r) r^{n-2} d r=1
$$

For $z^{\prime} \in \mathrm{R}^{n-1}$ we let $\hat{e}\left(z^{\prime}\right)=e\left(\left|z^{\prime}\right|\right) \in \mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n-1}\right)$. Then we define

$$
\begin{equation*}
\rho(x)=k \int_{\mathrm{R}^{n-1}}\left(x_{n}-f\left(y^{\prime}\right)\right)^{2-n} \hat{e}\left(\frac{y^{\prime}-x^{\prime}}{c\left(x_{n}-f\left(y^{\prime}\right)\right)}\right) d y^{\prime} \tag{8.2a}
\end{equation*}
$$

where

$$
\begin{align*}
& c=\max \left[t:\left(\frac{1-t \mathrm{M}}{1+t \mathrm{M}}\right)^{2 n-3} \geqslant 1-\varepsilon\right. \text { and }  \tag{8.2b}\\
& \left.(1-(2 n-3) t \mathrm{M}) \frac{(1-t \mathrm{M})^{n-2}}{(1+t \mathrm{M})^{n}} \geqslant 1-\varepsilon\right]
\end{align*}
$$

and

$$
\begin{equation*}
k=(1+c \mathrm{M})\left(\frac{c(1+c \mathrm{M})}{1-c \mathrm{M}}\right)^{1-n} . \tag{8.2c}
\end{equation*}
$$

We note that with this choice of $c, c \mathrm{M}<1$ and $c<\frac{1}{\mathrm{M}} \leqslant 1$. Furthermore, it follows easily from ( $8.2 b$ ) that there exists a positive constant $a$ (depending only on $n$ ) such that

$$
\begin{equation*}
c \mathrm{M}>a \varepsilon \tag{8.2d}
\end{equation*}
$$

For $x \in \mathrm{D}_{+}$(i.e. $x_{n}>f\left(x^{\prime}\right)$ ) and y satisfying

$$
\left|x^{\prime}-y^{\prime}\right| \leqslant c\left|x_{n}-f\left(y^{\prime}\right)\right|
$$

we have

$$
\begin{aligned}
& x_{n}-f\left(y^{\prime}\right) \geqslant x_{n}-f\left(x^{\prime}\right)-\left|f\left(x^{\prime}\right)-f\left(y^{\prime}\right)\right| \\
& \quad \geqslant x_{n}-f\left(x^{\prime}\right)-M\left|x^{\prime}-y^{\prime}\right| \geqslant x_{n}-f\left(x^{\prime}\right)-c \mathrm{M}\left|x_{n}-f\left(y^{\prime}\right)\right| .
\end{aligned}
$$

Since $c \mathrm{M}<1$ we have $x_{n}>f\left(y^{\prime}\right)$. Similarly,

$$
x_{n}-f\left(y^{\prime}\right) \leqslant x_{n}-f\left(x^{\prime}\right)+c \mathrm{M}\left|x_{n}-f\left(y^{\prime}\right)\right| .
$$

From these inequalities we conclude
(8.3) $\quad x_{n}>f\left(x^{\prime}\right) \quad$ and $\quad\left|x^{\prime}-y^{\prime}\right| \leqslant c\left|x_{n}-f\left(y^{\prime}\right)\right| \quad$ imply $0<\frac{1}{1+c \mathrm{M}}\left(x_{n}-f\left(x^{\prime}\right)\right) \leqslant x_{n}-f\left(y^{\prime}\right) \leqslant \frac{1}{1-c \mathrm{M}}\left(x_{n}-f\left(x^{\prime}\right)\right)$.

From (8.3) we get $\rho \in \mathrm{C}^{\infty}\left(\mathrm{D}_{+}\right)$and in analogy with the proof of Theorem I,

$$
\left(\frac{1-c \mathrm{M}}{1+c \mathrm{M}}\right)^{2 n-3}\left(x_{n}-f\left(x^{\prime}\right)\right) \leqslant \rho(x) \leqslant x_{n}-f\left(x^{\prime}\right)
$$

which by the choice of $c$ proves i ).
It can be checked that

$$
\mathrm{D}_{i} \rho(x)=k c^{-|i|} \int\left(x_{n}-f\left(y^{\prime}\right)\right)^{2-n-\{i \mid} h\left(c, \frac{x^{\prime}-y^{\prime}}{c\left(x_{n}-f\left(y^{\prime}\right)\right)}\right) d y^{\prime}
$$

where $h\left(c, z^{\prime}\right)$ is a polynomial in $c$ with coefficients which are $\mathrm{C}_{0}^{\infty}$ functions in $z^{\prime}$ vanishing for $\left|z^{\prime}\right| \geqslant 1$. Furthermore, $h\left(c, z^{\prime}\right)$ is completely determined by $\hat{e}\left(z^{\prime}\right), n$, and the indicial system $i$.

Since $c \leqslant 1$ we have $\left|h\left(c, z^{\prime}\right)\right| \leqslant \mathrm{A}_{i i, n}$, where $\mathrm{A}_{\mid i, n}$ depends only on $|i|$ and $n$.

To complete the proof of part ii) we use the inequalities (8.3) and the formulas (8.2c) and (8.2d). The constant $\mathrm{B}_{|i|}$ is then given by $\frac{\omega_{n-1}}{n-1}\left(\frac{2}{a}\right)^{|i|} \mathrm{A}_{\mid i, n, n}$.

For a fixed $x \in \mathrm{D}_{+}$consider the transformation

$$
\begin{equation*}
z^{\prime}=\frac{y^{\prime}-x^{\prime}}{c\left(x_{n}-f\left(y^{\prime}\right)\right)} \tag{8.4}
\end{equation*}
$$

of points $y^{\prime}$ in the domain $\left[y^{\prime}:\left|y^{\prime}-x^{\prime}\right|<c\left(x_{n}-f\left(y^{\prime}\right)\right)\right]$ into points $z^{\prime}$. It is obviously a Lipschitzian transformation. What is more, the inverse exists and is also Lipschitzian.

In fact (8.3) gives

$$
\begin{aligned}
& \left|\frac{\bar{y}^{\prime}-x^{\prime}}{c\left(x_{n}-f\left(\bar{y}^{\prime}\right)\right)}-\frac{y^{\prime}-x^{\prime}}{c\left(x_{n}-f\left(y^{\prime}\right)\right)}\right| \\
& =\frac{\left|\left(\bar{y}^{\prime}-y^{\prime}\right)\left(x_{n}-f\left(y^{\prime}\right)\right)+\left(y^{\prime}-x^{\prime}\right)\left(f\left(\bar{y}^{\prime}\right)-f\left(y^{\prime}\right)\right)\right|}{c\left(x_{n}-f\left(\bar{y}^{\prime}\right)\right)\left(x_{n}-f\left(y^{\prime}\right)\right)} \\
& \geqslant \frac{(1-c \mathrm{M})^{2}}{c\left(x_{n}-f\left(x^{\prime}\right)\right)^{2}}\left[\left|\bar{y}^{\prime}-y^{\prime}\right|\left(x_{n}-f\left(y^{\prime}\right)\right)-\left|y^{\prime}-x^{\prime}\right| \mathrm{M}\left|\bar{y}^{\prime}-y^{\prime}\right|\right] \\
& \geqslant \frac{(1-c \mathrm{M})^{3}\left|\bar{y}^{\prime}-y^{\prime}\right|}{c(1+c \mathrm{M})\left(x_{n}-f\left(x^{\prime}\right)\right)}
\end{aligned}
$$

It follows that the transformation (8.4) can be applied in the usual way to change variables in an integral. Its gradient and Jacobian may only exist almost everywhere. The Jacobian, wherever it exists, can be evaluated as follows :

$$
\begin{aligned}
& \frac{\partial z_{k}}{\partial y_{j}}=\left(\frac{\delta_{j k}}{c\left(x_{n}-f\left(y^{\prime}\right)\right)}+\frac{y_{k}-x_{k}}{c\left(x_{n}-f\left(y^{\prime}\right)\right)^{2}} \cdot \frac{\partial f}{\partial y_{j}}\left(y^{\prime}\right)\right) \\
&=\left(x_{n}-f\left(y^{\prime}\right)\right)^{-1}\left(\frac{\delta_{j k}}{c}+z_{k} \frac{\partial f}{\partial y_{j}}\right)
\end{aligned}
$$

It is easy to verify that

$$
\operatorname{det}\left(\frac{\partial z_{k}}{\partial y_{j}}\right)=\left[c\left(x_{n}-f\left(y^{\prime}\right)\right)\right]^{1-n}\left[1+c \sum_{l=1}^{n-1} z_{l} \frac{\partial f}{\partial y_{l}}\right]
$$

Furthermore since $\left|\nabla f\left(y^{\prime}\right)\right| \leqslant M$ and $c \mathrm{M}<1$ we have for $\left|z^{\prime}\right| \leqslant 1$

$$
\begin{equation*}
0<\frac{c^{n-1}}{1+c \mathrm{M}} \leqslant \frac{\left(x_{n}-f\left(y^{\prime}\right)\right)^{1-n}}{\operatorname{det}\left(\frac{\partial z_{k}}{\partial y_{j}}\right)} \leqslant \frac{c^{n-1}}{1-c \mathrm{M}}<\infty \tag{8.5}
\end{equation*}
$$

We pass now to the proof of iii). From (8.2) we have (with $\left.\boldsymbol{e}^{\prime}(\boldsymbol{r})=\frac{d e}{d r}(\boldsymbol{r})\right)$,
$\frac{\partial \rho}{\partial x_{n}}=k \int\left(x_{n}-f\left(y^{\prime}\right)\right)^{1-n}$
$\left[(2-n) e\left(\frac{\left|x^{\prime}-y^{\prime}\right|}{c\left(x_{n}-f\left(y^{\prime}\right)\right)}\right)-\frac{\left|x^{\prime}-y^{\prime}\right|}{c\left(x_{n}-f\left(y^{\prime}\right)\right)} e^{\prime}\left(\frac{\left|x^{\prime}-y^{\prime}\right|}{c\left(x_{n}-f\left(y^{\prime}\right)\right)}\right)\right] d y^{\prime}$
$=k \int\left(x_{n}-f\left(y^{\prime}\right)\right)^{1-n}\left[(2-n) e\left(\left|z^{\prime}\right|\right)-\left|z^{\prime}\right| e^{\prime}\left(\left|z^{\prime}\right|\right)\right]\left|\operatorname{det}\left(\frac{\partial z_{k}}{\partial y_{j}}\right)\right|^{-1} d z^{\prime}$.

From the properties of $e$ we note that $e^{\prime}\left(\left|z^{\prime}\right|\right) \leqslant 0$ for all $z^{\prime}$ and that $e^{\prime}\left(\left|z^{\prime}\right|\right)$ and $e\left(\left|z^{\prime}\right|\right)=0$ for $\left|z^{\prime}\right| \geqslant 1$. Thus from (8.5) we have

$$
\begin{aligned}
\frac{\partial \rho}{\partial x_{n}} \geqslant & k \omega_{n-1} \\
& \quad\left[-\frac{c^{n-1}}{1-c \mathrm{M}}(n-2) \int_{0}^{1} e(r) r^{n-2} d r-\frac{c^{n-1}}{1+c \mathrm{M}} \int_{0}^{1} e^{\prime}(r) r^{n-1} d r\right] \\
& =k c^{n-1}\left[-\frac{n-2}{1-c \mathrm{M}}+\frac{n-1}{1+c \mathrm{M}}\right] \\
= & k c^{n-1}(1-(2 n-3) c \mathrm{M}) /(1-c \mathrm{M})(1+c \mathrm{M}) \geqslant 1-\varepsilon
\end{aligned}
$$

by ( $8.2 b$ ) and ( $8.2 c$ ). This completes the proof of Theorem II.
Let F and $\mathrm{F}_{1}$ be non-empty closed sets in $\mathrm{R}^{n}, \mathrm{~F} \neq \mathrm{F}_{1}$, and $H=F \cap F_{1}$. For $\varepsilon>0$ we define

$$
\mathrm{U}_{\varepsilon} \equiv \mathrm{U}_{\varepsilon}\left(\mathrm{F}, \mathrm{~F}_{1}\right)=\left[x: r_{\mathrm{F}}(x)<\varepsilon r_{\mathrm{F}_{4}}(x)\right]
$$

an open set. Clearly, $\mathrm{F}-\mathrm{H} \subset \mathrm{U}_{\varepsilon} \subset \mathrm{R}^{n}-\mathrm{F}_{1}$.
For $0<\varepsilon<1$ we define the singular multiplier for the triple $\left\{\mathrm{F}, \mathrm{F}_{1}, \varepsilon\right\}$ by

$$
\varphi(x)= \begin{cases}\left(\theta_{\rho}(x)\right)^{-n} \int_{\mathrm{R}^{n}-\mathrm{F}_{1}} \chi(y) e\left(\frac{x-y}{\theta_{\rho}(x)}\right) d y, & x \in \mathrm{R}^{n}-\mathrm{F}_{1}  \tag{8.6}\\ 0, & x \in \mathrm{~F}_{1}\end{cases}
$$

where $\rho(x) \equiv \rho_{F_{4}, \mathrm{~s}}(x)$ is the regularized distance given in Theorem I, $\chi(y)$ is the characteristic function of $\mathrm{U}_{\mathrm{E} / 2}\left(\mathrm{~F}, \mathrm{~F}_{1}\right)$, $\theta=\varepsilon /(2+\varepsilon)$ and $e(z)$ is a fixed regularizing function with support in $|z|<1$.

Theorem III. - The singular multiplier $\varphi(x)$ for the triple $\left\{\mathrm{F}, \mathrm{F}_{1}, \varepsilon\right\}$ satisfies:
i) $0 \leqslant \varphi(x) \leqslant 1, \varphi(x)=1$ on $\mathrm{F}-\mathrm{H}$ and $=0$ on $\mathrm{R}^{n}-\mathrm{U}_{\varepsilon}$,
ii) $\varphi \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}-\left[\left(\overline{\mathrm{F}-\mathrm{F}_{1}}\right) \cap \mathrm{F}_{1}\right]\right)$ and

$$
\left|\mathrm{D}_{i} \varphi(x)\right| \leqslant \mathrm{B}_{|i|}^{1}\left(\operatorname{Max}\left[\varepsilon \varepsilon_{\mathrm{F}_{4}}(x), r_{\mathrm{F}-\mathrm{F}_{4}}(x)\right]\right)^{-|i|}
$$

where $\mathrm{B}_{|i|}^{1}$ depends only on $|i|$ and $n$.
Proof. - The first part of i) follows from the properties of a regularizing function. If $x \in \mathrm{~F}-\mathrm{H}$ and $|x-y|<\theta_{\rho}(x)$, then by Theorem $\mathrm{I}, r_{\mathrm{F}}(y) \leqslant|x-y|<\theta r_{\mathrm{F}_{\mathbf{t}}}(x)$ and

$$
r_{\mathrm{F}_{4}}(y) \geqslant r_{\mathrm{F}_{4}}(x)-|x-y|>(1-\theta) r_{\mathrm{F}_{4}}(x)
$$

which implies $y \in \mathrm{U}_{\varepsilon / 2}$ and by (8.7), that $\varphi(x)=1$. If $x \in \mathrm{R}^{n}-\mathrm{U}_{\varepsilon}$ and $|x-y|<\theta_{\rho}(x)$ then

$$
r_{\mathrm{F}_{4}}(y) \leqslant r_{\mathrm{F}_{4}}(x)+|x-y| \leqslant(1+\theta) r_{\mathrm{F}_{4}}(x)
$$

and $\quad r_{\mathrm{F}}(y) \geqslant r_{\mathbf{F}}(x)-|x-y| \geqslant(\varepsilon-\theta) r_{\mathbf{r}_{4}}(x) \quad$ which implies $y \notin \mathrm{U}_{\mathrm{\varepsilon} / 2}$ and by (8.6) that $\varphi(x)=0$, which completes the proof of part i).

To prove the first part of ii) it is clear by part i) that we may restrict our considerations to $\overline{\mathrm{U}}_{\varepsilon}$. If $x \in \overline{\mathrm{U}}_{\varepsilon}-\mathrm{F}_{1}$, then we know that $\varphi(x)$ has infinitely many derivatives. If $x \in \bar{U}_{\varepsilon} \cap \mathrm{F}_{1}$ then $0=r_{\mathrm{F}}(x)=r_{\mathrm{F}_{1}}(x)$, but since $\mathrm{U}_{\varepsilon} \cap \mathrm{F}_{1}=0$, this implies that $x \in \overline{\left(F-F_{1}\right)} \cap \mathrm{F}_{1}\left({ }^{28}\right)$. Hence

$$
\varphi \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}-\left[\left(\overline{\mathrm{F}-\mathrm{F}_{1}}\right) \cap \mathrm{F}_{1}\right]\right) .
$$

To prove the inequality in ii) it is enough to consider $x \in \overline{\mathrm{U}}_{\varepsilon}-\left[\left(\overline{\mathrm{F}-\mathrm{F}_{1}}\right) \cap \mathrm{F}_{2}\right]=\overline{\mathrm{U}}_{\varepsilon}-\mathrm{F}_{1}$.

By (2.6) and Theorem I we have for $p$ a positive integer (the indices in the summation below satisfy : $1 \leqq l \leqq|j|,\left|s^{(m)}\right| \geqq 1$, $\bigcup_{1}^{U} s^{(m)}=j$ )
(8.7) $\left|\mathrm{D}_{j}\left(\theta_{\rho}(x)\right)^{-p}\right|$

$$
\begin{aligned}
& =\left|\Sigma \theta^{-p} \frac{(-1)^{l}}{l!} \frac{(p+l-1)!}{(p-1)!} \rho(x)^{-p-l} \prod_{m=1}^{l} \mathrm{D}_{s^{(m)} \rho}(x)\right| \\
& \leqslant M_{[j}^{(1)]} \varepsilon^{-p-|j|} r_{\mathrm{F}_{4}}(x)^{-p-|j|},
\end{aligned}
$$

where $M_{[j]}^{(1)}$ depends only on $p,|j|$, and $n$.
For $\left|x_{l}-y_{l}\right|<\theta_{\rho}(x)$ we have by (2.5) and (8.7),

$$
\begin{aligned}
& \left.\left|\mathrm{D}_{s}^{(x)}\left(\frac{x_{l}-y_{l}}{\theta_{\rho}(x)}\right)\right|=\left.\left|\left(x_{l}-y_{l}\right) \mathrm{D}_{s}\left(\theta^{-1} \rho(x)^{-1}\right)+\sum_{j \cup(l)=s} \mathrm{D}_{j}\left(\theta^{-1} \rho(x)^{-1}\right)\right|\right|^{(29}\right) \\
& \leqslant \theta_{\rho}(x) M_{[s}^{(1)} \varepsilon^{-1-|s|} r_{\mathrm{F}_{4}}(x)^{-1-|s|} \\
& +\left.\sum_{j U(l)=s} M_{\{j \mid}^{(1)} \varepsilon^{-1-|j|}\right|_{\mathbf{F}_{4}}(x)^{-1-|j|} \\
& \leqslant \mathrm{M}_{[s ;}^{(2)} \varepsilon^{-1 s} \mid r_{\mathrm{F}_{1}}(x)^{-|s|}
\end{aligned}
$$

where $\mathrm{M}_{\{s \mid}^{(2)}$ depends only on $n$ and $|s|$.
$\left({ }^{(28)}\right.$ In fact $x=\lim x^{(k)}, \quad r_{\mathrm{F}}\left(x^{(k)}\right)=\left|x^{(k)}-y^{(k)}\right|<\varepsilon r_{\mathrm{F}_{1}}\left(x^{(k)}\right), \quad y^{(k)} \in \mathrm{F}-\mathrm{F}_{1}$,
$y^{(k)} \rightarrow x$.
$\left({ }^{(29)} \mathrm{D}_{s}^{(x)} f(x, y)\right.$ means differentiate $f(x, y)$ with respect to the $x$ variables.

Since $e(z)$ vanishes for $|z| \geqslant 1$ we have by the above and (2.6)

$$
\begin{align*}
& \left|\mathrm{D}_{k}^{(x)} e\left(\frac{x-y}{\theta_{\rho}(x)}\right)\right|  \tag{8.8}\\
& =\left|\sum_{\substack{t \mid t \\
m=1 \\
s(m)=k \\
s(m)} 1} \frac{1}{|t|!}\left(\mathrm{D}_{t} e\right)\left(\frac{x-y}{\theta_{\rho}(x)}\right) \prod_{m=1}^{|t|} \mathrm{D}_{s(m)}^{(x)}\left(\frac{x_{t_{m}}-y_{t_{m}}}{\theta_{\rho}(x)}\right)\right| \\
& \leqslant \Sigma \frac{1}{|t|!}\left|\left(\mathrm{D}_{t} e\right)\left(\frac{x-y}{\theta \rho(x)}\right) \sum_{m=1}^{|t|} M_{\left[s^{(m)} \mid\right.}^{(2)} \varepsilon^{-\left|s^{(m)}\right|} r_{\mathrm{F}_{4}}(x)^{-\left|s^{(m)}\right|}\right| \\
& \leqslant M_{\mid k}^{(3)} \varepsilon^{-1 k \mid} r_{\mathrm{F}_{1}}(x)^{-|k|}
\end{align*}
$$

where $M_{[k]}^{(3)}$ depends only on $k$ and $n$. Hence by (8.7), (8.8), and (2.5),

$$
\begin{aligned}
\mathrm{D}_{i}^{(x)} & { \left.\left[\left(\theta_{\rho}(x)\right)^{-n} e\left(\frac{x-y}{\theta_{\rho}(x)}\right)\right] \right\rvert\, } \\
& =\left|\sum_{j U_{k=i}} D_{j}\left(\theta^{-n} \rho(x)^{-n}\right) \mathrm{D}_{k}^{(x)}\left(e\left(\frac{x-y}{\theta_{\rho}(x)}\right)\right)\right| \leqslant \mathrm{M}_{i \mid}^{(4)}\left(\varepsilon r_{\mathrm{F}_{4}}(x)\right)^{-n-|i|}
\end{aligned}
$$

where $M_{(i)}^{(4)}$ depends only on $|i|$ and $n$. Therefore we have by (8.6), $\left|\mathrm{D}_{i} \varphi(x)\right| \leqslant \mathrm{B}_{|i|}^{1}\left(\varepsilon r_{\mathrm{F}_{1}}(x)\right)^{-1 i}$. To replace $\varepsilon r_{\mathrm{F}_{4}}(x)$ here by $\max \left[\varepsilon \varepsilon_{\mathrm{F}_{4}}(x), r_{\mathrm{F}-\mathrm{F}_{1}}(x)\right]$ it is enough to notice that for $x \in \overline{\mathrm{U}}_{\varepsilon}-\mathrm{F}_{1}$ there is a $y \in \mathrm{~F}$ such that $|x-y|=r_{\mathrm{F}}(x) \leqslant \varepsilon r_{\mathrm{F}_{4}}(x)<r_{\mathrm{F}_{4}}(x)$, i.e. $y \notin \mathrm{~F}_{1}$. This implies $r_{\mathrm{F}-\mathrm{F}_{4}}(x)=r_{\mathrm{F}}(x) \leqslant \varepsilon r_{\mathrm{F}_{4}}(x) \quad$ which completes the proof of part ii).

Remark 2. - The singular multiplier will be used for sets F and $\mathrm{F}_{1}$ which are the closures of open sets, i.e. $\mathrm{F}=\overline{\mathrm{D}}, \mathrm{F}_{1}=\overline{\mathrm{D}}_{1}$, $D$ and $D_{1}$ open sets. In these cases we shall write that $« \varphi$ is the singular multiplier corresponding to the triple $\left\{\mathrm{D}, \mathrm{D}_{1}, \varepsilon\right\}$ ) instead of " $\left\{F, F_{1}, \varepsilon\right\}$ ).

## 9. Vanishing of potentials.

In this section we prove three theorems in connection with the vanishing of potentials. These theorems will be applied in § 11.
We begin with a few definitions. Let $x(t), 0 \leqslant t \leqslant 1$ be a simple arc in $\mathrm{R}^{n}$. For any $x, 0<x<1$, we call the open set $\bigcup_{i} \mathrm{~S}(x(t), x|x(t)-x(0)|)$ a conoid with vertex $x(0)$, opening $x$,
axial arc $x(t)$ and radius $|x(1)-x(0)|$. We shall consider the following property of an open set D :
(C) There exists $r$ and $x, r>0,0<x<1$ such that for every $x \in \mathrm{~d} \mathrm{D}$ there is a conoid lying in D with vertex $x$, opening $x$ and radius $r$.

For brevity we will call a domain with the above property a (C)-domain with constants $\%$ and $r$.

Remark 1. - Two immediate properties of condition (C) are:
a) If D is a $(\mathrm{C})$-domain then $|\partial \mathrm{D}|=0$ (similar proof to the one given in footnote ( ${ }^{6}$ ), p. 16).
b) The ( C ) condition is invariant under a $\mathrm{C}^{(0,1)}$-homeomorphism. In particular if $\mathrm{C}^{*}$ is the image of a conoid C with constants $x$ and $r$ and vertex $x$ under a $\mathrm{C}^{(0,1)}$-homeomorphism T , and M is the Lipschitz constant of T and $\mathrm{T}^{-1}$ then $\mathrm{C}^{*}$ contains a conoid with constants $x / \mathrm{M}^{2}$ and $r / \mathrm{M}$ and vertex $\mathrm{T}(x)$.

Let $l^{-}$be the half-line from $x$ in the direction - $\theta$ ( $\theta$ a unit vector) and D an open set. We define

$$
r_{\mathrm{D}, 0}(x)=\left\{\begin{array}{lll}
r_{l}-\mathrm{nD}(x) & \text { if } & l^{-} \cap \mathrm{D} \neq 0 \\
\infty & \text { if } & l^{-} \cap \mathrm{D}=0
\end{array}\right.
$$

It is easy to prove that $r_{\mathrm{D}, \theta}(x)$ is an upper semi-continuous function of $\theta$ and $x$.

Lemma 1. - For $\alpha \geqslant 0$, a) If F is a measurable subset of $\mathrm{R}^{n}$ and $x \in \mathrm{R}^{n}-\overline{\mathrm{F}}$ then

$$
\begin{equation*}
\int_{F} \frac{d y}{|x-y|^{n+2 \alpha}} \leqslant \frac{\omega_{n}}{2 \alpha} r_{F}(x)^{-2 \alpha} . \tag{9.1}
\end{equation*}
$$

b) If D is an open set and $x \in \mathrm{R}^{n}-\overline{\mathrm{D}}$, and at a point $x_{0} \in \partial \mathrm{D}$ where $r_{\mathrm{D}}(x)=\left|x-x_{0}\right|$ there exists a conoid lying in D spith vertex $x_{0}$, radius $r$ and opening $x$, then

$$
\begin{equation*}
\int_{\mathrm{D}} \frac{d y}{|x-y|^{n+2 \alpha}} \geqslant \frac{c_{1} x^{n-1}}{\alpha}\left[r_{\mathrm{D}}(x)^{-2 \alpha}-c_{2} r^{-2 \alpha}\right] \tag{9.2}
\end{equation*}
$$

where $c_{1}$ and $c_{2}$ are positive constants depending only on $n$ and $\alpha^{*}$.

$$
\text { Proof. }-\int_{\mathrm{F}} \frac{d y}{|x-y|^{n+2 \alpha}} \leqslant \int_{r_{r}(x)}^{\infty} \int_{\partial s(0,1)} \rho^{-1-2 \alpha} d \theta d \rho \leqslant \frac{\omega_{n}}{2 \alpha} r_{\mathrm{F}}(x)^{-2 \alpha} .
$$ To prove (9.2) we restrict the integration to the conoid and take polar coordinates with pole at $x_{0}$. Since the angular opening with respect to $x_{0}$ of the conoid at any distance less than $r$ from $x_{0}$ is greater than $\frac{\omega_{n-1}}{n-1} x^{n-1}$ we have

$$
\int_{\mathrm{D}} \frac{d y}{|x-y|^{n+2 \alpha}} \geqslant \frac{\omega_{n-1}}{n-1} x^{n-1} \int_{0}^{r} \frac{\rho^{n-1} d \rho}{\left(r_{\mathrm{D}}(x)+\rho\right)^{n+2 \alpha}} .
$$

By repeated integration by parts it is not difficult to show

$$
\begin{aligned}
& \int_{0}^{r} \frac{\rho^{n-1} d \rho}{\left(r_{\mathrm{D}}(x)+\rho\right)^{n+2 \alpha}} \geqslant-r^{-2 \alpha}\left[\frac{\Gamma(n) \Gamma(2 \alpha+1)}{\Gamma(n+2 \alpha) 2 \alpha}+\sum_{j=1}^{n-1} \frac{\Gamma(j+2 \alpha)}{\Gamma(j+1)}\right] \\
& \quad+r_{\mathrm{D}}(x)^{-2 \alpha} \frac{\Gamma(n) \Gamma(2 \alpha+1)}{\Gamma(n+2 \alpha) 2 \alpha}
\end{aligned}
$$

and (9.2) follows.
Lemma 2. - For $\alpha \geqslant 0$, a) if $x \in \mathrm{R}^{n}-\overline{\mathrm{D}}$ then

$$
\begin{equation*}
\int_{\partial s(0,1)} r_{\mathrm{D}, \theta}(x)^{-2 \alpha} d \theta \leqslant \omega_{n} r_{\mathrm{D}}(x)^{-2 \alpha} . \tag{9.3}
\end{equation*}
$$

b) If $x \in \mathrm{R}^{n}-\overline{\mathrm{D}}$ and at $x_{0} \in \mathrm{D} \mathrm{D}$ where $r_{\mathrm{D}}(x)=\left|x-x_{0}\right|$ there exists a conoid lying in D with vertex $x_{0}$, radius $r$ and opening $x$, then

$$
\begin{equation*}
r_{\mathrm{D}}(x)^{-2 \alpha} \leqslant \frac{9^{\alpha}(n-1) 2^{n-1}}{\omega_{n-1} x^{n-1}} \int_{\partial \mathrm{s}(0,1)} r_{\mathrm{D}, \theta}(x)^{-2 \alpha} d \theta+r^{-2 \alpha} \tag{9.4}
\end{equation*}
$$

Proof. - Since $r_{\mathrm{D}}(x) \leqslant r_{\mathrm{D}, \theta}(x)$, (9.3) is clear. If $r_{\mathrm{D}}(x) \geqslant r$ then (9.4) is clearly true. Suppose $r_{\mathrm{D}}(x)<r$. Then from the hypotheses it is clear that there exists on the axial arc of the conoid a point $x_{1} \in \mathrm{D}$ such that $\left|x_{0}-x_{1}\right|=r_{\mathrm{D}}(x)$ and

$$
\mathrm{S}=\mathrm{S}\left(x_{1}, \chi r_{\mathrm{D}}(x)\right) \subset \mathrm{D}
$$

Therefore $r_{\mathrm{s}, \theta}(x) \geqslant r_{\mathrm{D}, \theta}(x)$ and if $r_{\mathrm{s}, \theta}(x) \neq \infty$, then

$$
\frac{r_{\mathrm{D}}(x)}{r_{\mathrm{s}, 9}(x)} \geqslant \frac{r_{\mathrm{D}}(x)}{r_{\mathrm{D}}(x)+(1+x) r_{\mathrm{D}}(x)} \geqslant \frac{1}{3} .
$$

Hence

$$
\begin{aligned}
\int_{\partial S(0,1)} r_{\mathrm{D}, \theta}(x)^{-2 \alpha} d \theta & \geqslant r_{\mathrm{D}}(x)^{-2 \alpha} \int_{r_{\mathrm{s}, 0}(x)<\infty}\left(\frac{r_{\mathrm{D}}(x)}{r_{\mathrm{s}, 0}(x)}\right)^{2 \alpha} d \theta \\
& \geqslant \frac{r_{\mathrm{D}}(x)^{-2 \alpha}}{3^{2 \alpha}} \int_{r_{\mathrm{s}, 0}(x)<\infty} d \theta \geqslant r_{\mathrm{D}}(x)^{-2 \alpha} \frac{x^{n-1} \omega_{n-1} 9^{-\alpha}}{2^{n-1}(n-1)}
\end{aligned}
$$

and (9.4) follows.
Lemma 3. - For $\frac{1}{2}<\alpha<1$ and $u \in \check{\mathrm{P}} \alpha(a, b)$ (b possibly
finite), infinite),

$$
\begin{equation*}
\int_{a}^{b}|u(x)-u(a)|^{2}(x-a)^{-2 \alpha} d x \leqslant \frac{\pi}{\left(\alpha-\frac{1}{2}\right)^{2}} d_{\alpha,(a, b)}(u), \tag{9.5}
\end{equation*}
$$

where $u(a)=\lim _{x \Downarrow a} u(x)$.
Proof $\left.{ }^{(30}\right)$. - Suppose $b<\infty$. Clearly we may assume that $a=0$ and by changing $x$ into $b x$ we may assume $b=1$. Then for $0<t<1$

$$
\begin{aligned}
& {\left[\int_{0}^{1}\left|u(x)-u\left(t^{n} x\right)\right|^{2} x^{-2 \alpha} d x\right]^{\frac{1}{2}}} \\
& \\
& \quad \leqslant \sum_{k=0}^{n-1}\left[\int_{0}^{1}\left|u\left(t^{k} x\right)-u\left(t^{k+1} x\right)\right|^{2} x^{-2 \alpha} d x\right]^{\frac{1}{2}} \\
&
\end{aligned} \leqslant\left[\int_{0}^{1}|u(x)-u(t x)|^{2} x^{-2 \alpha} d x\right]^{\frac{1}{2}} \sum_{k=0}^{n-1} t^{k\left(\alpha-\frac{1}{2}\right)} .
$$

Since $\check{\mathrm{P}}^{\alpha}(a, b)=\mathrm{P}^{\alpha}(a, b)$ by Prop. $\left.4^{\prime}\right), \S 3$, there exists an extension of $u, \tilde{u} \in \mathrm{P}^{\alpha}\left(\mathrm{R}^{\mathbf{1}}\right)$. For $\alpha>\frac{1}{2}$ the functions in $\mathrm{P}^{\alpha}\left(\mathrm{R}^{1}\right)$ are continuous (cf. Prop. 4), §5, II). Hence

$$
\lim _{x \vee 0} u(x)=u(0)
$$

exists. Letting $n \rightarrow \infty$ in the above we have

$$
\begin{aligned}
\left(1-t^{\alpha-\frac{1}{2}}\right)^{2} \int_{0}^{1}|u(x)-u(0)|^{2} x^{-2 \alpha} & d x \\
& \leqslant \int_{0}^{1}|u(x)-u(t x)|^{2} x^{-2 \alpha} d x
\end{aligned}
$$

and since

$$
d_{\alpha,(0,1)}(u)=\frac{2}{\mathrm{C}(1, \alpha)} \int_{0}^{1} \int_{0}^{1} \frac{|u(x)-u(t x)|^{2}}{x^{2 \alpha}(1-t)^{1+2 \alpha}} d x d t
$$

$\left({ }^{30}\right)$ The proof of the lemma is based on an idea from [1].
we have
$\left[\frac{2}{\mathrm{C}(1, \alpha)} \int_{0}^{1} \frac{\left(1-t^{\alpha-\frac{1}{2}}\right)^{2}}{(1-t)^{1+2 \alpha}} d t\right] \int_{0}^{1}|u(x)-u(0)|^{2} x^{-2 \alpha} d x \leqslant d_{\alpha,(0,1)}(u)$.
It is easy to show that the square bracketed term is bounded from below by $\left(\alpha-\frac{1}{2}\right)^{2} / \pi$ which yields the inequality.

If $b=\infty$ then $u \in \check{\mathrm{P}}^{\alpha}(0, \mathrm{~N})$ for every positive integer N ; letting $\mathrm{N} \rightarrow \infty$ yields the inequality in this case.

Lemma 3 will often be applied in the following situation. The function $u$ belongs to $\check{\mathrm{P}}^{\alpha}(\mathrm{I}), \frac{1}{2}<\alpha<1$, I being an interval of the line $l=l_{\theta, z^{\prime}}=\left[z: z=z^{\prime}+s \theta,-\infty<s<\infty\right] \subset \mathrm{R}^{n}$. Furthermore, $u\left(z^{\prime}+s \theta\right)=0$ for $z^{\prime}+s \theta \in \mathrm{D}, \mathrm{D}$ a relatively open subset of I. Then it is immediately checked that with our definition of $r_{D, \theta}(z)$, Lemma 3 gives

$$
\begin{align*}
\int_{\mathrm{I}-\overline{\mathrm{D}}}\left|u\left(z^{\prime}+s \theta\right)\right|^{2} r_{\mathrm{D}, \theta}\left(z^{\prime}\right. & +s \theta)^{-2 \alpha} d s  \tag{9.6}\\
& \leqslant \frac{\pi}{\left(\alpha-\frac{1}{2}\right)^{2}} d_{\alpha, \mathrm{I}-\overline{\mathrm{D}}}\left(u\left(z^{\prime}+s \theta\right)\right)
\end{align*}
$$

We define for functions $u \in$ Pr $^{\alpha}\left(\mathrm{D}_{1}\right)$ the quadratic form

$$
\begin{equation*}
\mathrm{J}_{\alpha, \mathbf{D}_{\mathbf{1}}, \mathbf{D}_{\mathbf{z}}}(u)=\sum_{|i| \leqslant \alpha^{*}} \int_{\mathbf{D}_{\mathbf{1}}}\left|\mathrm{D}_{i} u(x)\right|^{2} r_{\mathrm{D}_{\mathbf{z}}}(x)^{-2 \alpha+2|i|} d x \tag{9.7}
\end{equation*}
$$

where $D_{2} \subset R^{n}$ is an open set. If $D_{1} \cap \bar{D}_{2} \neq 0$ we adopt the convention that $\left|\mathrm{D}_{i} u(x)\right|^{2} r_{\mathrm{D}_{\mathbf{i}}}(x)^{-2 \alpha+2|i|}=0$ wherever

$$
\mathrm{D}_{i} u(x)=0
$$

regardless of whether $r_{D_{\mathbf{z}}}(x)^{-2 \alpha+2|i|}=\infty$ or not. Also, if $\alpha=0$ we adopt the customary convention that $\mathrm{J}_{0, \mathrm{D}_{\mathbf{1}}, \mathrm{D}_{\mathbf{2}}}(u)=0$.

Theorem I. - If $\mathrm{D}=\left[\mathrm{D}_{1} \cup \mathrm{D}_{2} \cup\left(\partial \mathrm{D}_{1} \cap \partial \mathrm{D}_{2}\right)\right]^{0}, \quad m=[\alpha]$, and $\beta=\alpha-m$, then:
a) If $u \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{D}_{1}\right)$ and $\mathrm{J}_{\alpha, \mathrm{D}_{1}, \mathrm{D}_{2}}(u)<\infty$, then $u$ has an extension $\tilde{u}$ in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ such that $\tilde{u}=0$ on $\mathrm{D}_{2}$ and

$$
\begin{equation*}
\left.|\tilde{u}|_{\alpha, \mathbf{D}}^{2} \leqslant|u|_{\alpha, \mathbf{D}_{1}}^{2}+2 n(1-\beta)\left[\mathbf{J}_{\alpha, \mathrm{D}_{1}, \mathrm{D}_{2}}(u)+|u|_{m, \mathrm{D}_{1}}^{2}\right] \quad{ }^{31}\right) \tag{9.8}
\end{equation*}
$$

${ }^{(31)}$ The second term on the right side of the inequality may be omitted if $\beta=0$ and the inequality becomes an equality.
b) If D is L -convex spith constants $\delta, p$, and $\mathrm{M}, \mathrm{D}_{2}$ is a (C)domain spith constants $r$ and $\times$ (and we shall assume $r \leqslant \delta$ ) and $u$ is a function in $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ such that $u=0$ on $\mathrm{D}_{2}$, then

$$
\begin{equation*}
\mathrm{J}_{\alpha, \mathrm{D}_{1}, \mathrm{D}_{\mathbf{2}}}(u) \leqslant c|u|_{\alpha, \mathrm{D}}^{2} \tag{9.9}
\end{equation*}
$$

shere $c$ depends only on $n, m, x, r, \mathrm{M}$ and $p$.
Proof of $a$ ). - The proof is trivial if $\alpha=0$ so we assume $\alpha>0$. Define $\varphi=u$ on $\mathrm{D}_{1}$ and $=0$ on $\mathrm{D}-\mathrm{D}_{1}$. We will show by an application of Prop. $2^{\prime}$ ), § 9, II that $\varphi$ is equivalent to a function in $\mathrm{P}_{10 \mathrm{c}}^{\alpha}(\mathrm{D})$. Consider the lines $l$ parallel to the $x_{k}$-axis such that
i)
ii)

$$
\begin{gathered}
\left.\sum_{j=0}^{m} \int_{\text {InD }}\left|\frac{\partial^{j} u}{}\right| \frac{\partial^{2}}{\partial x_{k}^{j}}\right|^{2} d x_{k}<\infty, \\
\sum_{j=0}^{\alpha+} \int_{\text {InD }}^{l}\left|\frac{\partial_{1} u}{\partial j_{k}^{j}}\right|^{2} r_{\mathrm{D}_{\mathbf{z}}}(x)^{-2 \alpha+2 j} d x_{k}<\infty
\end{gathered}
$$

and
iii) $\frac{\partial^{j} u}{\partial x_{k}^{j}}, j=0, \ldots, m-1$, is absolutely continuous on $l \cap \mathrm{D}_{1}$.

These conditions hold for almost all lines $l$.
Let $l \cap D_{1}=\bigcup_{v} I_{v}$ a union of mutually disjoint open intervals. By virtue of (i) and (iii) $\frac{\partial^{j} u}{\partial x_{k}^{\prime}}, j=0, \ldots, m-1$, is absolutely and uniformly continuous on each $\mathrm{I}_{v}$ and in view of (ii) it must converge to 0 at the endpoints of the $I_{v}$ 's which lie in $\overline{\mathrm{D}}_{2} \cap \mathrm{D}$. Hence if we extend $\frac{\partial^{j} u}{\partial x^{j}}, j=0, \ldots, m$ to the whole of $l \cap \mathrm{D}$ by 0 and denote this extension by $\varphi_{j}$, then $\varphi_{j}$, $j=0, \ldots, m-1$, is absolutely continuous on $l \cap \mathrm{D}$ and is the indefinite integral of $\varphi_{j+1}$ on each interval of $l \cap D$. If $\beta=0$ then $\varphi_{m} \in \mathrm{P}_{\mathrm{loc}}^{0}(\mathrm{D})$ and if $\beta>0$ then by Lemma 1 , a) and (2.7), and since $\mathrm{D}-\mathrm{D}_{1} \subset \overline{\mathrm{D}}_{2}$,
(9.10) $\quad d_{\beta, \mathbf{D}}\left(\varphi_{m}\right)$
$=d_{\beta, \mathrm{D}_{1}}\left(\frac{\partial^{m} u}{\partial x_{k}^{m}}\right)+\frac{2}{\mathrm{C}(n, \beta)} \int_{\mathrm{D}_{\mathbf{1}}}\left|\frac{\partial^{m} u}{\partial x_{k}^{m}}(x)\right|^{2} \int_{\mathrm{D}-\mathrm{D}_{\mathbf{1}}} \frac{d y}{|x-y|^{n+2 \beta}} d x$
$\leqslant d_{\beta, \mathrm{D}_{4}}\left(\frac{\partial^{m} u}{\partial x_{k}^{m}}\right)+2 n \int_{\mathrm{D}_{\mathbf{1}}}\left|\frac{\partial^{m} u}{\partial x_{k}^{m}}\right|^{2} r_{\mathrm{D}_{\mathbf{2}}}(x)^{-2 \beta} d x<\infty$,
and $\varphi_{m}$ is equivalent to a function in $\mathrm{P}_{\text {ioc }}^{\beta}(\mathrm{D})$. Hence $\varphi$ is equivalent to a function in $\mathrm{P}_{\text {loc }}^{\alpha}(\mathrm{D})$ by the cited proposition.

If $\tilde{u}$ is the correction of $\varphi$ then $\tilde{u}=0$ on $\mathrm{D}_{2}$ since $\varphi=0$ on $D-D_{1}$ by definition, and $=0$ on $D_{1} \cap \bar{D}_{2}$ by the finiteness of $\mathrm{J}_{\alpha, \mathrm{D}_{1}, \mathrm{D}_{z}}(u)$. Furthermore, $\tilde{u} \in \mathrm{P}_{\mathrm{loc}}^{\alpha}(\mathrm{D})$, and to complete the proof we need only to prove (9.8).

By a calculation similar to (9.10) (for $\beta>0$ ),

$$
\begin{aligned}
& \left.|\tilde{u}|_{\alpha, \mathrm{D}}^{2}=|u|_{\alpha, \mathbf{D}_{\mathbf{1}}}^{2}+\frac{2}{\mathrm{C}(n, \beta)} \sum_{k=0}^{m} \sum_{k}^{m}\right) \sum_{|i|=k} \int_{\mathbf{D}_{\mathbf{1}}}\left|\mathrm{D}_{i} u(x)\right|^{2} \int_{\mathbf{D}-\mathbf{D}_{\mathbf{1}}} \frac{d y}{|x-y|^{n+2 \beta}} d x \\
& \leqslant|u|_{\alpha, \mathbf{D}_{4}}^{2} \\
& +2 n(1-\beta) \sum_{k=0}^{m}\binom{m}{k} \sum_{\mid i=k} \int_{\mathrm{D}_{1}}\left|\mathrm{D}_{i} u(x)\right|^{2}\left(r_{\mathrm{D}_{2}}(x)^{-2 \alpha+2 i \mid}+1\right) d x \\
& \leqslant|u|_{\alpha, \mathrm{D}_{4}}^{2}+2 n(1-\beta)\left(\mathrm{J}_{\alpha, \mathrm{D}_{1}, \mathrm{D}_{2}}(u)+|u|_{m_{,}, \mathbf{D}_{4}}^{2}\right) .
\end{aligned}
$$

Proof of $b$ ). - i) Suppose we have two open coverings $\left\{\mathrm{V}_{k}\right\}$ and $\left\{\mathrm{W}_{k}\right\}$ of $\left(\mathrm{D}_{1}-\overline{\mathrm{D}}_{2}\right) \cap \mathrm{S}\left(\mathrm{D}_{2}, \delta / 8\right)$, with $\mathrm{V}_{k} \subset \mathrm{~W}_{k}$ and such that
(9.11) any point in $\mathrm{R}^{n}$ is in at most $p^{\prime}=5^{n}+p$ sets $\mathrm{W}_{k}$.

In addition suppose that for $|i|<m$,
(9.12a) $\quad \int_{\mathrm{v}_{k} \cap \mathrm{D}_{4}}\left|\mathrm{D}_{i} u\right|^{2} r_{\mathrm{D}_{\mathbf{z}}}(x)^{-2 \alpha+2|i|} d x$
$\leqslant c^{\prime}\left(\int_{\mathbf{w}_{k} \cap \mathrm{D}_{1}}\left|\mathrm{D}_{i} u\right|^{2} d x+\int_{\mathrm{w}_{k} \cap \mathrm{D}_{1}} \sum_{l=1}^{n}\left|\frac{\partial}{\partial x_{l}} \mathrm{D}_{i} u\right|^{2} r_{\mathrm{D}_{\mathbf{2}}}(x)^{-2 \alpha+2|i|+2} d x\right)$,
and for $|i|=m$

$$
\begin{equation*}
\int_{\mathrm{v}_{k} \cap \mathrm{D}_{4}}\left|\mathrm{D}_{i} u\right|^{2} r_{\mathrm{D}_{2}}(x)^{-2 \beta} d x \leqslant c^{\prime \prime}\left|\mathrm{D}_{i} u\right|_{\beta, \mathrm{w}_{k} \cap \mathrm{D}}^{2} \tag{9.12b}
\end{equation*}
$$

where $c^{\prime}$ and $c^{\prime \prime}$ depend only on $n, m, x, r$ and $M$.
Then for $|i|<m$, since $\left|\partial \mathrm{D}_{2}\right|=0$ and $u=0$ on $\mathrm{D}_{2}$, we have by $(9.12 a)$

$$
\begin{aligned}
& \int_{\mathrm{D}_{\mathbf{1}}}\left|\mathrm{D}_{i} u\right|^{2} r_{\mathrm{D}_{\mathbf{s}}}(x)^{-2 \alpha+2 i \mid} d x \leqslant(\delta / 8)^{-2 \alpha+2|i|} \int_{\mathrm{D}_{\mathbf{1}}}\left|\mathrm{D}_{i} u\right|^{2} d x \\
& +\int_{\left(\mathrm{D}_{1}-\overline{\mathrm{D}}_{2}\right) \mathrm{ns}\left(\mathbb{D}_{\mathfrak{w}} \delta \delta / 8\right)}\left|\mathrm{D}_{i} u\right|^{2} r_{\mathrm{D}_{2}}(x)^{-2 \alpha+2 i \mid} d x \\
& \leqslant(\delta / 8)^{-2 \alpha+2|i|} \int_{\mathrm{D}_{1}}\left|\mathrm{D}_{i} u\right|^{2} d x \\
& +\sum_{k=1}^{\infty} \int_{\mathrm{v}_{k} \mathrm{n} \mathrm{D}_{4}}\left|\mathrm{D}_{i} u\right|^{2} r_{\mathrm{D}_{\mathrm{s}}}(x)^{-2 \alpha+2|i|} d x \\
& \leqslant\left(c^{\prime} p^{\prime}+(\delta / 8)^{2 \alpha+2 i i l}\right) \int_{\mathrm{D}_{\mathrm{i}}}\left|\mathrm{D}_{i} u\right|^{2} d x \\
& +c^{\prime} p^{\prime} \sum_{l=1}^{n} \int_{\mathrm{D}_{4}}\left|\frac{\partial}{\partial x_{l}} \mathrm{D}_{i} u\right|^{2} r_{\mathrm{D}_{\mathrm{z}}}(x)^{-2 \alpha+2 l i+2} d x \text {. }
\end{aligned}
$$

Hence $\mathrm{I}=\int_{\mathrm{D}_{i}}\left|\mathrm{D}_{i} u\right|^{2} r_{\mathrm{D}_{2}}(x)^{-2 \alpha+2|i|} d x$ is majorated by $\left|\mathrm{D}_{i} u\right|_{0, \mathrm{D}_{4}}^{2}$ and $\sum_{|j|=|i|+1} \int_{\mathrm{D}_{1}}\left|\mathrm{D}_{j} u\right|^{2} r_{\mathrm{D}_{2}}(x)^{-2 \alpha+2|j|} d x$ and by an easy inductive argument we have finally, that $I$ is majorated by $\left|D_{i} u\right|_{m-|i|, D_{1}}^{2}$ and $\sum_{|j|=m} \int_{\mathrm{D}_{1}}\left|\mathrm{D}_{j} u\right|^{2} r_{\mathrm{D}_{2}}(x)^{-2 \beta} d x$.

For $|i|=m$ we have, by $(9.12 b)$,

$$
\int_{\mathrm{D}_{4}}\left|\mathrm{D}_{i} u\right|^{2} r_{\mathrm{D}_{2}}(x)^{-2 \beta} d x \leqslant\left((\delta / 8)^{-2 \beta}+2 c^{\prime \prime} p^{\prime}\right)\left|\mathrm{D}_{i} u\right|_{\beta, \mathrm{D}}^{2}
$$

and thus we obtain finally (9.9).
ii) Before we construct the coverings $\left\{\mathrm{V}_{k}\right\}$ and $\left\{\mathrm{W}_{k}\right\}$ and establish the properties $(9.12 a)$ and $(9.12 b)$ we prove the following.

Lemma 4. - Suppose $\mathrm{D}^{*}$ is a convex domain, $\mathrm{D}_{1}^{*}$ and $\mathrm{D}_{2}^{*}$ are disjoint open subsets of $\mathrm{D}^{*}$. Furthermore, suppose
$\left(^{*}\right)$ There is $a x^{*}$ and $r^{*}$ such that for any $x \in \mathrm{D}_{1}^{*}$ there is an $x_{0} \in \partial \mathrm{D}_{2}^{*}$ with $r_{\mathrm{D}_{2}^{*}}(x)=\left|x-x_{0}\right|$ and a conoid with vertex $x_{0}$, opening $x^{*}$ and radius $r^{*}$ lying in $\mathrm{D}_{2}^{*}$.

If $\varphi \in$ P $^{1}\left(\mathrm{D}^{*}\right)$ and $\rho=0$ on $\mathrm{D}_{2}^{*}$ then for any $\gamma \geqslant 1$
(9.13a)

$$
\begin{aligned}
& \int_{\mathrm{D}_{1}^{*}}|\rho(x)|^{2} r_{\mathrm{D}_{2}^{*}}(x)^{-2 \gamma} d x \\
\leqslant & c 9 \gamma x^{*(1-n)}\left[r^{*-2 \gamma}|\rho|_{0, \mathrm{D}^{*}}^{2}+\sum_{l=1}^{n} \int_{\mathbf{D}^{*}}\left|\frac{\partial \varphi}{\partial x_{l}}\right|^{2} r_{\mathrm{D}_{2}^{*}}(x)^{-2 \gamma+2} d x\right] .
\end{aligned}
$$

If $\varphi \in \check{\mathrm{P}}^{\beta}\left(\mathrm{D}^{*}\right), 0<\beta<1$, and $\varphi=0$ on $\mathrm{D}_{2}^{*}$ then
(9.13b) $\quad \int_{\mathrm{D}_{1}^{*}}|\rho(x)|^{2} r_{\mathrm{D}_{2}^{*}}(x)^{-2 \beta} d x$

$$
\leqslant c x^{*(1-n)}\left[r^{*-2 \beta}|\rho|_{0, \mathrm{D}^{*}}^{2}+d_{\beta, \mathrm{D}^{*}}(\varphi)\right]
$$

where $c$ in both cases depends only on $n$.
To prove (9.13) we need an inequality due to Hardy (Part. I, § 12) which will be used in other proofs of this section.

Hardy's Inequality. - If $f(s)$ is absolutely continuous for $a \leqslant s<b$, then for any $\gamma>\frac{1}{2}$

$$
\begin{align*}
\int_{a}^{b} \mid f(s)- & \left.f(a)\right|^{2}(s-a)^{-2 \gamma} d s  \tag{9.14}\\
& \leqslant\left(\gamma-\frac{1}{2}\right)^{-2} \int_{a}^{b}\left|f^{\prime}(s)\right|^{2}(s-a)^{-2 \gamma+2} d s
\end{align*}
$$

Let $l_{\theta, z^{\prime}}=\left[z: z=z^{\prime}+s \theta,-\infty<s<\infty\right]$. Then if $\varphi$ satisfies the hypothesis of (9.13a), $\quad \rho\left(z^{\prime}+s \theta\right) \in \mathrm{P}^{1}\left(l_{\theta, z^{\prime}} \cap \mathrm{D}^{*}\right)$ by Prop. $2^{\prime}$ ), § 3 for almost all $\theta$ and $z^{\prime}$. Since $\varphi=0$ on $D_{2}^{*}$, and in view of the definition of $r_{\mathrm{D}_{2}, 0}(x)$ we have from (9.14) following the notation of (4.1)
$\int_{\partial \mathrm{S}} \int_{\mathrm{D}^{*}}|\varphi(x)|^{2} r_{\mathrm{D}_{2}^{*}, \theta}(x)^{-2 \gamma} d x d \theta$
$=\int_{\partial \mathrm{S}} \int_{\mathrm{E}_{\theta}\left(\mathrm{D}^{*}\right)} \int_{\mathrm{I}\left(\theta, z^{\prime}\right)}\left|\rho\left(z^{\prime}+s \theta\right)\right|^{2} r_{\mathrm{D}_{2}^{*}, \theta}\left(z^{\prime}+s \theta\right)^{-2 \gamma} d s d z^{\prime} d \theta$
$\leqslant\left(\gamma-\frac{1}{2}\right)^{-2} \int_{\partial S} \int_{\mathrm{E}_{\theta}\left(D^{+}\right)} \int_{\mathrm{I}\left(\theta, z^{\prime}\right)}\left|\frac{\partial \varphi}{\partial_{s}}\left(z^{\prime}+s \theta\right)^{2}\right|_{\mathrm{D}_{2}, \theta}\left(z^{\prime}+s \theta\right)^{-2 \gamma+2}$ $d s d z^{\prime} d \theta$ $\leqslant \omega_{n}\left(\gamma-\frac{1}{2}\right)^{-2} \sum_{l=1}^{n} \int_{\mathbf{D}^{*}}\left|\frac{\partial \varphi^{2}}{\partial x_{l}}\right|^{2} r_{\mathbf{D}_{\mathbf{2}}}(x)^{-2 \gamma+2} d x$.

The last inequality was obtained by Lemma 2, a) (note that $\gamma \geqslant 1$ ). An application of Lemma 2, b) completes the proof of (9.13a).

To prove (9.13b) we consider two cases

$$
0<\beta \leqslant \frac{3}{4}, \frac{3}{4}<\beta<1
$$

In the first case we have by Lemma $1, b$ ),

$$
\begin{aligned}
& d_{\beta, \mathbf{D}^{*}}(\varphi) \geqslant \frac{2}{\mathrm{C}(n, \beta)} \int_{\mathbf{D}_{\mathbf{*}}} \int_{\mathbf{D}_{\mathbf{*}}^{*}} \frac{|\varphi(x)|^{2}}{|x-y|^{n+2 \beta}} d x d y \\
& \quad \geqslant \frac{2 x^{*(n-1)} c_{1}}{\beta \mathrm{C}(n, \beta)}\left[\int_{\mathbf{D}_{\mathbf{t}}^{*}}|\varphi(x)|^{2} r_{\mathbf{D}_{\mathbf{t}}^{\mathbf{t}}}(x)^{-2 \beta} d x-c_{2} r^{*-2 \beta} \int_{\mathbf{D}_{\mathbf{i}}}|\varphi(x)|^{2} d x\right] .
\end{aligned}
$$

Since $\frac{1}{\beta C(n, \beta)}$ is uniformly bounded from below in $0<\beta \leqslant \frac{3}{4},(9.13 b)$ is proved in this case.

If $\frac{3}{4}<\beta<1$ we write by (4.1)

$$
d_{\beta, \mathrm{D}^{*}}(\varphi)=\frac{\mathrm{C}(1, \beta)}{2 \mathrm{C}(n, \beta)} \int_{\partial \mathrm{S}} \int_{\mathrm{E}_{\boldsymbol{\gamma}\left(\mathrm{D}^{*}\right)}} d_{\beta, \mathrm{I}\left(\theta, z^{\prime}\right)}\left(\varphi\left(z^{\prime}+s \theta\right)\right) d z^{\prime} d \theta .
$$

Applying Lemma 3 in the form (9.6) to $d_{\beta, 1\left(\theta, z^{\prime}\right)}\left(\rho\left(z^{\prime}+s \theta\right)\right)$ and then restricting the integration to $\mathrm{D}_{1}^{*}(9.13 b)$ follows by an application of Lemma 2,b) and (4.2).
iii) We pass now to the construction of the coverings $\left\{\mathrm{V}_{k}\right\}$ and $\left\{\mathrm{W}_{k}\right\}$ used in part i).

Consider a maximal set $\mathrm{A} \subset \mathrm{R}^{n}$ with the property that for any $a^{\prime} \in \mathrm{A}, a^{\prime \prime} \in \mathrm{A}, a^{\prime} \neq a^{\prime \prime}$, we have $\left|a^{\prime}-a^{\prime \prime}\right| \geqslant \delta / 4$. Such sets obviously exist and are enumerable. Furthermore we note the following four elementary facts ( $a$ will denote an arbitrary point in A$): 1^{0}$ the spheres $\mathrm{S}(a, \delta / 8)$ are mutually disjoint; $2^{\circ}$ the spheres $\mathrm{S}(a, \delta / 2)$ form a $\delta / 4$-loose covering of $\mathrm{R}^{n} ; 3^{\circ}$ any point in $\mathrm{R}^{n}$ lies in at most $5^{n}$ distinct spheres $\mathrm{S}(a, \delta / 2) ; 4^{\circ}$ for $a \in \mathrm{D}^{\delta / 2}$ the spheres $\mathrm{S}(a, \delta / 2)$ form a $\delta / 4$-loose covering of $\mathrm{D}^{38 / 4}$ and each of these lies in $D$.

By hypothesis of part b) of our theorem there exists a covering $\left\{\mathrm{U}_{l}\right\}$ of $\partial \mathrm{D}, \delta$-loose and of rank $p$, such that each $\mathrm{U}_{l} \cap \mathrm{D}$ is the image of a convex domain by a $\mathrm{C}^{(0,1)}$-homeomorphism with constant $M(\geqslant 1)$. It follows that $\left\{U_{l}\right\}$ is a $\delta / 4$-loose covering of $\overline{\mathrm{S}(\partial \mathrm{D}, 3 \delta / 4)}$; hence, combined with $\mathrm{S}(a, \delta / 2)$ for $a \in \mathrm{D}^{\delta / 2}$, it forms a $\delta / 4$-loose covering of $\overline{\mathrm{D}}$. The sets of this combined covering will be denoted by $\mathrm{W}_{k}$. Obviously each point of $\mathrm{R}^{n}$ lies in at most $p^{\prime}=5^{n}+p$ of the sets $\mathrm{W}_{k}$. Furthermore each $\mathrm{W}_{k} \cap \mathrm{D}$ is transformed by a $\mathrm{C}^{(0,1)}$-homeomorphism $\mathrm{T}_{k}$ with constant M on a convex domain (if $\mathrm{W}_{k}=\mathrm{S}(a, \delta / 2), \mathrm{T}_{k}$ is the identity). We put

$$
\mathrm{V}_{k}=\mathrm{W}_{k}^{\delta / 4} \cap \mathrm{~S}\left(\overline{\mathrm{D}}_{2}, \delta / 8\right) \cap\left(\mathrm{D}_{1}-\overline{\mathrm{D}}_{2}\right) .
$$

Obviously $\left\{\mathrm{V}_{k}\right\}$ and $\left\{\mathrm{W}_{k}\right\}$ satisfy the conditions of part i) of our proof and it remains to prove (9.12a) and (9.12b).

If $\mathrm{V}_{k}=0$ there is nothing to prove. Therefore we assume $\mathrm{V}_{k} \neq 0$. Set

$$
\mathrm{D}^{*}=\mathrm{T}_{k}\left(\mathrm{~W}_{k} \cap \mathrm{D}\right), \mathrm{D}_{1}^{*}=\mathrm{T}_{k}\left(\mathrm{~V}_{k}\right), \mathrm{D}_{2}^{*}=\mathrm{T}_{k}\left(\mathrm{~W}_{k} \cap \mathrm{D}_{2}\right) .
$$

We will consider $\mathrm{T}_{k}$ as extended by continuity to a homeomorphism of $\overline{W_{k} \cap D}$ onto $\overline{\mathrm{D}}^{*}$.

If $x \in \mathrm{~V}_{k}$ then $r_{\mathrm{D}_{2}}(x)<\delta / 8$ and there exists $x_{0} \in \overline{\mathrm{D}}_{2}$ with $\left|x-x_{0}\right|=r_{\mathrm{D}_{2}}(x)<\delta / 8$. Hence $x_{0} \in \mathrm{~W}_{k}^{\delta / 8}, x_{0} \in \overline{\mathrm{~W}_{k} \cap} \overline{\mathrm{D}_{2}}$, (this proves that $\mathrm{W}_{k} \cap \mathrm{D}_{2}$ and $\mathrm{D}_{2}^{*}$ are $\left.\neq 0\right), \mathrm{T}_{k}\left(x_{0}\right) \in \overline{\mathrm{D}}_{2}^{*}$ and

$$
r_{\mathrm{D}_{\mathbf{2}}^{*}}\left(\mathrm{~T}_{k}(x)\right) \leqslant\left|\mathrm{T}_{k}(x)-\mathrm{T}_{k}\left(x_{0}\right)\right| \leqslant \mathrm{M}\left|x-x_{0}\right|=\mathrm{M} r_{\mathrm{D}_{\mathbf{2}}}(x) .
$$

On the other hand if $x \in \mathrm{~W}_{k} \cap \mathrm{D}, r_{D_{2}^{*}}\left(\mathrm{~T}_{k}(x)\right)=\left|\mathrm{T}_{k}(x)-x_{0}^{*}\right|$ with $x_{0}^{*} \in \overline{\mathrm{D}}_{2}^{*}$, hence

$$
r_{\mathrm{D}_{\mathbf{z}}}(x) \leqslant\left|x-\mathrm{T}^{-1}\left(x_{0}^{*}\right)\right| \leqslant \mathrm{M}\left|\mathrm{~T}_{k}(x)-x_{0}^{*}\right|=\mathrm{M} r_{\mathrm{D}_{\mathbf{z}}^{*}}\left(\mathrm{~T}_{k}(x)\right) .
$$

Since $\mathrm{D}^{*}, \mathrm{D}_{1}^{*}$, and $\mathrm{D}_{2}^{*}$ obviously satisfy the conditions of Lemma 4 with $x^{*}=x / \mathrm{M}^{2}$ and $r^{*}=\min [\delta / 16 \mathrm{M}, r / \mathrm{M}]$, the formulas (9.13a) and (9.13b) with $\varphi\left(x^{*}\right)=\mathrm{D}_{i} u\left(\mathrm{~T}^{-1}\left(x^{*}\right)\right)$ are transformed immediately into ( $9.12 a$ ) and ( $9.12 b$ ) respectively by virtue of the above relations between $r_{\mathrm{D}_{\mathbf{2}}}(x)$ and $r_{\mathrm{D}_{2}^{*}}\left(\mathrm{~T}_{k} x\right)$ and known properties of $\mathrm{C}^{(0,1)}$-homeomorphisms (f.i. Prop. 8), § 2).

Remark 2. - The L-convexity of D in part $b$ ) of Theorem I was needed in order to allow us to apply Lemma 4. For $\alpha<1$ only the (C)-condition for $D_{2}$ is needed to obtain (9.9) by direct application of Lemma 1, b). However, the constant $c$ in (9.9), so obtained, blows up when $\alpha \uparrow 1$.

In the next two theorems we will consider open sets $D_{1}$ and $\mathrm{D}_{2}$ and the open sets $\mathrm{U}_{\eta} \equiv \mathrm{U}_{\eta}\left(\overline{\mathrm{D}}_{1}, \overline{\mathrm{D}}_{2}\right)$ introduced in $\S 8$. We remind the reader that $\mathrm{U}_{\eta}=\left[x: r_{\mathrm{D}_{4}}(x)<\eta r_{\mathrm{D}_{2}}(x)\right]$ and that for $\eta>0, D_{1}-D_{2} \subset U_{\eta} \subset R^{n}-\bar{D}_{2}$. We shall use the notation
$(+) \quad \mathrm{U}_{\eta}^{+}=\mathrm{D}_{1} \cup \mathrm{U}_{\eta} \equiv \mathrm{D}_{1} \cup \mathrm{U}_{\eta}\left(\overline{\mathrm{D}}_{1}, \overline{\mathrm{D}}_{2}\right)$.
Theorem II. - If $\mathrm{D}_{1}$ is a (C)-domain with opening $x$ and radius $r$, and if $u \in \breve{\mathrm{P}}^{\alpha}\left(\mathrm{U}_{\eta}^{+}\right)$then for $\varepsilon=\eta /(9 \eta+4)\left({ }^{32}\right)$

$$
\begin{equation*}
\mathrm{J}_{\alpha, \mathrm{U}_{\mathrm{E}}^{+}, \mathbf{D}_{\mathbf{z}}}(u) \leqslant c\left[|u|_{\alpha, \mathrm{U}_{n}^{+}}^{2}+\mathrm{J}_{\alpha, \mathbf{D}_{\mathbf{u}}, \mathbf{D}_{\mathbf{q}}}(u)\right] \tag{9.15}
\end{equation*}
$$

where $c$ depends only on $\eta, \alpha^{*}, n, x$ and $r$.
Proof. - We will write $r_{1}(x)$ and $r_{2}(x)$ instead of $r_{\mathrm{D}_{1}}(x)$ and $r_{\mathrm{D}_{\mathbf{2}}}(x)$.

Let $m=[\alpha]$ and $\beta=\alpha-m$. The proof will be divided into three parts. Parts $1^{\circ}$ and $2^{\circ}$ will be concerned with showing that for $|i|=m$ and $\varepsilon^{\prime}=\eta /(3 \eta+2)$

$$
\left.\begin{array}{rl}
\int_{\mathrm{v}_{i^{+}}}\left|\mathrm{D}_{i} u(x)\right|^{2} r_{2}(x)^{-2 \beta} d x  \tag{9.16}\\
& \leqslant c^{\prime}\left[\int_{\mathrm{D}_{1}}\left|\mathrm{D}_{i} u(x)\right|^{2} r_{2}(x)^{-2 \beta} d x+\left|\mathrm{D}_{i} u\right|{ }_{\beta}^{2}, \mathrm{U}_{n}^{+}\right.
\end{array}\right] .
$$

Part $3^{0}$ deals with lower derivatives: we shall show that with $\varepsilon=\varepsilon^{\prime} /\left(3 \varepsilon^{\prime}+2\right)=\eta /(9 \eta+4)$

$$
\begin{align*}
\sum_{|i|<m} \int_{\mathrm{U}_{i}^{+}} & \left|\mathrm{D}_{i} u(x)\right|^{2} r_{2}(x)^{-2 \alpha+2|i|} d x  \tag{9.17}\\
& \leqslant c^{\prime \prime}\left[\mathrm{J}_{\alpha, \mathrm{D}_{1}, \mathrm{D}_{2}}(u)+\sum_{|\mathrm{i}|=m} \int_{\mathrm{v}_{t_{i}^{+}}}\left|\mathrm{D}_{i} u\right|^{2} r_{2}(x)^{-2 \beta} d x\right]
\end{align*}
$$

${ }^{\left({ }^{32}\right)}$ By a more elaborate proof we could prove (9.15) with $\varepsilon=\eta /(3 \eta+2)$.

The constants $c^{\prime}$ and $c^{\prime \prime}$ in (9.16) and (9.17) depend only on $n, \eta, \alpha^{*}, r$, and $k$. Inequality (9.15) then follows from (9.16) and (9.17) since $\mathrm{U}_{\varepsilon} \subset \mathrm{U}_{\varepsilon^{\prime}}$.

In parts $1^{\circ}$ and $2^{0}$ we shall let $\varphi=\mathrm{D}_{i} u,|i|=m$. Then $\varphi \in \check{\mathrm{P}}^{\beta}\left(\mathrm{U}_{n}^{+}\right)$. If $\beta=0,(9.16)$ is obviously true with $c^{\prime}=1$ so we assume $\beta>0$.
$1^{0}$ Suppose $0<\beta \leqslant 3 / 4$. For $x \in \mathrm{D}_{1}$ and $y \in \mathrm{U}_{\mathrm{e}^{\prime}}^{+}-\overline{\mathrm{D}}_{1}$ we write the inequality

$$
\begin{align*}
& \mathrm{I}_{1} \equiv \iint \frac{|\varphi(y)|^{2}}{|x-y|^{n+2 \beta}} d y d x  \tag{9.18}\\
& \mathrm{D}_{1} \mathrm{v}_{2}^{+}, \overline{\mathrm{D}}_{4} \\
& |x-y|>\frac{1}{2} r_{2}(x) \\
& \leqslant 2 \iint \frac{|\varphi(x)-\varphi(y)|^{2}}{|x-y|^{n+2 \beta}} d y d x \\
& \begin{array}{l}
\mathrm{D}_{0} \mathrm{U}_{0}^{+}+\overline{\mathrm{D}}_{1} \\
|x-y|>\frac{1}{2} r_{2}(x)
\end{array} \\
& +2 \iint \frac{|\varphi(x)|^{2}}{|x-y|^{n+2 \beta}} d y d x \equiv \mathrm{I}_{2}+\mathrm{I}_{3} . \\
& \mathrm{D}_{1} \mathrm{U}_{\mathrm{i}}^{+}-\overline{\mathrm{D}_{4}} \\
& |x-y|>\frac{1}{2} r_{r}(x)
\end{align*}
$$

Clearly,

$$
\begin{aligned}
& \mathrm{I}_{3} \leqslant 2 \omega_{n} \int_{\mathrm{D}_{\mathbf{1}}}|\rho(x)|^{2} \int_{\rho>\frac{1}{2} r_{2}(x)}^{\mathrm{I}_{2} \leqslant \mathrm{C}(n, \beta)} d_{\beta, \mathrm{U}_{n}^{+}(\rho)} \\
& \rho^{-1-2 \beta} d \rho d x \\
& \leqslant \frac{\omega_{n}}{\beta} 2^{2 \beta} \int_{\mathrm{D}_{4}}|\rho(x)|^{2} r_{2}(x)^{-2 \beta} d x
\end{aligned}
$$

We notice now that if $y_{0} \in \partial \mathrm{D}_{1}$ satisfies $\left|y_{0}-y\right|=r_{1}(y)<\varepsilon^{\prime} r_{2}(y)$ and if $\left|x-y_{0}\right|>\left(1+\varepsilon^{\prime}\right) r_{2}(y)$, then $|x-y|>\frac{1}{2} r_{2}(x)$ (since $\left.|x-y| \geqslant\left|x-y_{0}\right|-\left|y_{0}-y\right| \geqslant r_{2}(y) \geqslant r_{2}(x)-|x-y|\right)$. Hence, by restricting the integration in $\mathrm{I}_{1}$ to y with $r_{2}(y)<r / 2$ and to $x$ lying in the conoid with vertex $y_{0}$ at distance

$$
\left|x-y_{0}\right|>\left(1+\varepsilon^{\prime}\right) r_{2}(y)
$$

and noticing that the conoid cuts out on $\partial \mathrm{S}\left(y_{0}, \rho\right)$ for $\rho<r$
an angular area $>\frac{\omega_{n-1}}{(n-1) 2^{n-1}} x^{n-1}$, we get

$$
\begin{aligned}
& \mathrm{I}_{1} \geqslant \frac{\omega_{n-1}}{(n-1) 2^{n-1}} x^{n-1} \int_{\substack{\mathrm{U}_{2}^{+}-\overline{D_{2}} \\
r_{2}(y)<r / 2}}^{\infty}|\rho(y)|^{2} \int_{\left(1+\varepsilon^{\prime}\right) r_{2}(y)\left(\varepsilon^{\prime} r_{2}(y)+\rho\right)^{n+2 \beta}}^{r} \frac{\rho^{n-1} d \rho}{\left({ }^{\prime}\right)} \\
& \geqslant \frac{1}{2 \beta} \frac{\omega_{n-1}}{(n-1) 2^{n-1}} x^{n-1}\left(1+\varepsilon^{\prime}\right)^{-n-4 \beta} \\
& \times\left[\int_{\substack{\mathbf{U}_{\mathbf{U}^{\prime}}^{+}-\bar{D}_{1} \\
r_{2}(y)<r / 2}}|\rho(y)|^{2} r_{2}(y)^{-2 \beta} d y-r^{-2 \beta}\left(1+\varepsilon^{\prime}\right)^{2 \beta} \int_{\substack{\mathrm{U}_{e^{\prime}}^{+}-\bar{D}_{1} \\
r_{2}(y)<r / 2}}|\rho(y)|^{2} d y\right] .
\end{aligned}
$$

Since $\beta C(n, \beta)$ is uniformly bounded for $0 \leqslant \beta<\frac{3}{4}$ and since

$$
\begin{aligned}
& \int_{\mathrm{U}_{\mathrm{e}^{\prime}}^{+}}|\varphi|^{2} r_{2}(y)^{-2 \beta} d y \leqslant \int_{\substack{\mathrm{U}^{t_{2}^{\prime}}-\overline{\mathrm{D}}_{\mathbf{1}}^{\prime} \\
r_{2}(y)<r / 2}}|\varphi(y)|^{2} r_{2}(y)^{-2 \beta} d y \\
&+\left(\frac{r}{2}\right)^{-2 \beta} \int_{\mathrm{U}_{\mathrm{z}^{\prime}}^{+}}|\varphi|^{2} d y+\int_{\mathrm{D}_{1}}|\rho(y)|^{2} r_{2}(y)^{-2 \beta} d y
\end{aligned}
$$

the inequality (9.16) is proved in the present case.
$2^{\circ}$ Suppose $\frac{3}{4} \leqslant \beta<1$. Let $l$ be a line in the direction of the unit vector $\theta$ and $z^{\prime}=\pi_{\theta} \cap l$ where $\pi_{\theta}$ is the subspace orthogonal to $\theta$. As before we write $l \equiv l_{\theta, z^{\prime}}=\left[z: z^{\prime}+t \theta\right]$. Suppose $l \cap \mathrm{D}_{1} \neq 0$ and $d_{\beta, \imath \cup_{\eta}^{+}}\left(\nu\left(z^{\prime}+t \theta\right)\right)<\infty$. We shall restrict our attention temporarily to this line and so shall write for $\varphi\left(z^{\prime}+t \theta\right)$ and $r_{2}\left(z^{\prime}+t \theta\right)$ simply $\varphi(t)$ and $r_{2}(t)$ respectively.

Define $s_{1}=s+\frac{\eta}{1+\eta} r_{2}(s)$ for $s \in l \cap D_{1}$. Since

$$
\left|r_{2}(s)-r_{2}\left(s^{\prime}\right)\right| \leqslant\left|s-s^{\prime}\right|
$$

$s_{1}$ is an increasing function of $s$. For

$$
\begin{gathered}
s<t<s_{1}, \quad|s-t|<\frac{\eta}{1+\eta} r_{2}(s) \\
r_{2}(s)-\frac{\eta}{1+\eta} r_{2}(s)<r_{2}(t)<r_{2}(s)+\frac{\eta}{1+\eta} r_{2}(s) \\
r_{1}(t) \leqslant|s-t|
\end{gathered}
$$

${ }^{(33)}$ Note that the inner integrand is

$$
\geqslant \rho^{-1-2 \beta}\left(\frac{\varepsilon^{\prime} r_{2}(y)}{\rho}+1\right)^{-n-2 \beta}>\rho^{-1-2 \rho}\left(1+\varepsilon^{\prime}\right)^{-n-2 \beta} .
$$

( $s$ being in $\mathrm{D}_{1}$ ), hence
(9.19) if $s<t<s_{1}$, then $\frac{1}{1+\eta} r_{2}(s)<r_{2}(t)<\frac{1+2 \eta}{1+\eta} r_{2}(s)$ and $z^{\prime}+t \theta \in \mathrm{U}_{\eta}$.

Applying the above and (9.5) we get
$\left(\frac{\eta}{1+\eta} r_{2}(s)\right)^{-2 \beta} \int_{s}^{s_{1}}|\nu(t)|^{2} d t \leqslant 2\left(\frac{\eta}{1+\eta} r_{2}(s)\right)^{-2 \beta} \int_{s}^{s_{1}}|\rho(s)|^{2} d t$ $+2\left(\frac{\eta}{1+\eta} r_{2}(s)\right)^{-2 \beta} \int_{s}^{s_{1}}|\varphi(t)-\varphi(s)|^{2} d t$
$\leqslant 2\left(\frac{\eta}{1+\eta} r_{2}(s)\right)^{-2 \beta}\left(s_{1}-s\right)|\varphi(s)|^{2}+2 \int_{s}^{s_{1}}|\varphi(t)-\varphi(s)|^{2}|t-s|^{-2 \beta} d t$ $\leqslant 2\left(\frac{\eta}{1+\eta} r_{2}(s)\right)^{-2 \beta+1}|\varphi(s)|^{2}+32 \pi d_{\beta,\left(s, s_{1}\right)}(\varphi)$.

Dividing by $\eta^{-2 \beta}(1+\eta)^{-1} r_{2}(s)$ and noticing that by (9.19) $r_{2}(s)<(1+\eta) r_{2}(t)$, we get
(9.20) $\int_{s}^{s_{1}}|\varphi(t)|^{2} r_{2}(t)^{-2 \beta-1} d t \leqslant 2 \eta(1+\eta)^{2 \beta}|\rho(s)|^{2} r_{2}(s)^{-2 \beta}$ $+32 \pi \eta^{2 \beta}(1+\eta) r_{2}(s)^{-1} d_{\beta,\left(s, s_{1}\right)}(\rho)$.

In view of (9.19) the set of points $s \in l \cap \mathrm{D}_{1}$ such that $s<t<s_{1}$ for a fixed $t$ on $l$ has a measure

$$
\mu_{\theta}(t) \equiv \mu_{\theta}\left(z^{\prime}+t \theta\right)
$$

satisfying $\mu_{\theta}(t) \leqslant \eta r_{2}(t)$ and for all such points $s$,

$$
\frac{1+\eta}{1+2 \eta} r_{2}(t)<r_{2}(s)<(1+\eta) r_{2}(t)
$$

Let $\mathrm{I}_{\theta}^{\prime}=\left[y=z^{\prime}+t \theta:\right.$ there is an $x \in \mathrm{D}_{1}, x=z^{\prime}+s \theta$, with $\left.s<t<s+\frac{\eta}{1+\eta} r_{2}(s)=s_{1}\right]$.

By (9.19), $\mathrm{I}_{\theta}^{\prime} \subset \mathrm{U}_{\eta}$. We perform now three integrations on both sides of (9.20) (compare notations with (4.1)),

$$
\int_{\mathrm{J} \mathrm{~S}}^{0} \int_{\mathrm{E}_{\theta}\left(\mathrm{D}_{1}\right)} \int_{\mathfrak{\mathrm { ID } \mathrm { D } _ { 1 }}} \ldots d s d z^{\prime} d \theta
$$

and obtain, following the above remarks,

$$
\begin{align*}
& \int_{\partial \mathrm{S}} \int_{\mathrm{I}_{\theta}^{\prime}}|\varphi(y)|^{2} r_{2}(y)^{-2 \beta-1} \mu_{\theta}(y) d y d \theta  \tag{9.21}\\
& \leqslant 2 \omega_{n} \eta(1+\eta)^{2 \beta} \int_{\mathrm{D}_{\mathbf{1}}}|\rho(x)|^{2} r_{2}(x)^{-2 \beta} d x \\
&+64 \pi \eta^{2 \beta+1}(1+2 \eta) \frac{\mathrm{C}(n, \beta)}{\mathrm{C}(1, \beta)} d_{\beta, \mathrm{U}_{n}}(\varphi) \tag{}
\end{align*}
$$

We aim now towards a lower bound for the left side of (9.21). Consider a point $y \in \mathrm{U}_{\varepsilon^{\prime}}-\overline{\mathrm{D}}_{1}$ with $r_{2}(y)<r / 2$. By a simple geometric argument we notice that if $y_{0} \in \partial \mathrm{D}_{1}$ with $\left|y-y_{0}\right|=r_{1}(y)<\varepsilon^{\prime} r_{2}(y)$ and if on the axial arc of the conoid with vertex $y_{0}$, lying in $\mathrm{D}_{1}$, we choose a point $y(\tau)$ with

$$
\left|y(\tau)-y_{0}\right|=\frac{\varepsilon^{\prime}}{4} r_{2}(y)<r
$$

then for every $z$ in the corresponding sphere $\mathrm{S}\left(y(\tau), \frac{x \varepsilon^{\prime}}{4} r_{2}(y)\right)$ we have $|z-y|<\frac{\eta}{\eta+1} r_{2}(z)$. It follows that for $\theta$ in the direction $\overline{z y}, y \in \mathrm{I}_{\theta}^{\prime}$. Furthermore, if $z$ is restricted to

$$
\mathrm{S}\left(y(\tau), \frac{x \varepsilon^{\prime}}{8} r_{2}(y)\right)
$$

the measure $\mu_{\theta}(y)>\frac{x \varepsilon^{\prime}}{4} r_{2}(y)$; the corresponding $\theta^{\prime}$ 's form an angular area $>\frac{\omega_{n-1}}{n-1}\left(\frac{x}{10}\right)^{n-1}$. Hence the lower bound for the left side of (9.21) is given by

$$
\frac{\omega_{n-1}}{n-1}\left(\frac{x}{10}\right)^{n-1} \frac{x \varepsilon^{\prime}}{4} \int_{\substack{\mathbf{U}_{\varepsilon}^{\prime}(y)<\bar{D}_{1}^{\prime} \\ \varepsilon_{2}}}|\varphi(y)|^{2} r_{2}(y)^{-2 \beta} d y
$$

and thus we get formula (9.16) by the same concluding argument as in part $1^{10}$.
$\left({ }^{34}\right)$ The last term is obtained by using the following evaluation :

$$
\begin{aligned}
& \int_{\operatorname{lnD_{1}}} r_{2}(s)^{-1} d_{\beta,\left(s, s_{1}\right)}(\varphi) d s=\int_{\ln \left(\mathrm{D}_{1}-\overline{\mathrm{D}}_{2}\right)} \ldots d s \\
& =\frac{1}{\mathrm{C}(1, \beta)} \int_{\text {InUn }} \int_{\text {InUn }} \frac{\left|\varphi(t)^{2}-q\left(t^{\prime}\right)\right|^{2}}{\left|t-t^{\prime}\right|^{1+2 \beta}} \int_{l \cap\left(\mathrm{D}_{1}-\mathrm{D}_{2}\right)} r_{2}(s)^{-1} \chi_{s}(t) \chi_{s}\left(t^{\prime}\right) d s d t d t^{\prime} \\
& \leqslant \frac{1}{\mathrm{C}(1, \beta)} \int_{\operatorname{In} \mathrm{U}_{n}}^{p} \int_{\text {InU }}^{p} \frac{\left|\varphi(t)-\varphi\left(t^{\prime}\right)\right|^{2}}{\left|t-t^{\prime}\right|^{2+2 \beta}} \frac{1+2 \eta}{1+\eta} r_{2}(t)^{-1} \mu_{9}(t) d t d t^{\prime} \\
& =\frac{1+2 \eta}{1+\eta} \eta d_{\beta, \text { inU } \eta}(\varphi) \text {, }
\end{aligned}
$$

where $\chi_{s}(t)$ is the characteristic function of the interval $\left(s, s_{1}\right)$.
$3^{\circ}$ We use the same notation as in part $2^{\circ}$ except we replace $\eta$ by $\varepsilon^{\prime}$ and $\varepsilon^{\prime}$ by $\varepsilon=\varepsilon^{\prime} /\left(3 \varepsilon^{\prime}+2\right)=\eta /(9 \eta+4)$. We now deal with the function $\varphi=\mathrm{D}_{i} u,|i|=q<m$. Hence $\varphi \in \check{\mathrm{P}}^{m-q}\left(\mathrm{U}_{\mathrm{\varepsilon}^{\prime}}^{+}\right)$ and on almost all lines parallel to $\theta, \frac{\partial^{\prime} \varphi}{\partial \theta^{\prime}} l=0,1, \ldots, m-q-1$, are absolutely continuous on $l \cap \mathrm{U}_{\varepsilon^{\prime}}^{+}$, with $\mathrm{L}^{2}$-derivatives. We obtain succesively for $s \in l \cap \mathrm{D}_{1}$,

$$
\begin{aligned}
& s<t<s_{1}=s+\frac{\varepsilon^{\prime}}{1+\varepsilon^{\prime}} r_{2}(s), \\
& \rho(t)=\sum_{k=0}^{m-q-1} \frac{1}{k!}(t-s)^{k} \frac{\partial^{k} \phi}{\partial \theta^{k}}(s) \\
& +\frac{1}{(m-q-1)!} \int_{s}^{t}(t-\tau)^{m-q-1} \frac{\partial^{m-q} \varphi}{\partial \theta^{m-q}}(\tau) d \tau, \\
& |\varphi(t)|^{2} \leqslant(m-q+1)\left(\sum_{k=0}^{m-q-1} \frac{(t-s)^{2 k}}{(k!)^{2}}\left|\frac{\partial^{k} \varphi}{\partial \theta^{k}}(s)\right|^{2}\right. \\
& \left.+\frac{(t-s)^{2 m-2 q-1}}{(2 m-2 q-1)((m-q-1)!)^{2}} \int_{s}^{t}\left|\frac{\partial^{m-q}}{\partial \theta^{m-q}}(\tau)\right|^{2} d \tau\right), \\
& \int_{s}^{s_{4}}|\varphi(t)|^{2} d t \leqslant(m-q+1)\left\{\sum_{k=0}^{m-q-1} \frac{1}{(k!)^{2}(2 k+1)}\right. \\
& \times\left(\frac{\varepsilon^{\prime}}{1+\varepsilon^{\prime}} r_{2}(s)\right)^{2 k+1}\left|\frac{\partial^{k} \varphi}{\partial \theta^{k}}(s)\right|^{2} \\
& +\frac{1}{(2 m-2 q-1)(2 m-2 q)((m-q-1)!)^{2}} \\
& \left.\times\left(\frac{\varepsilon^{\prime}}{1+\varepsilon^{\prime}} r_{2}(s)\right)^{2 m-2 q} \int_{s}^{s_{1}}\left|\frac{\partial^{m-q} \varphi}{\partial \theta^{m-q}}(\tau)\right|^{2} d \tau\right\} .
\end{aligned}
$$

Multiplying now by $\left(\frac{1}{1+\varepsilon^{\prime}} r_{2}(s)\right)^{-2 \alpha+2 q-1}$ and applying (9.19)
we get we get

$$
\begin{aligned}
& \int_{s}^{s_{4}}|\rho(t)|^{2} r_{2}(t)^{-2 \alpha+2 q-1} d t \\
& \leqslant\left(1+\varepsilon^{\prime}\right)^{2 \alpha-2 q+1}(m-q+1)\left\{\sum_{k=0}^{m-q-1} \frac{1}{(k!)^{2}(2 k+1)}\right. \\
& \quad \times\left(\frac{\varepsilon^{\prime}}{1+\varepsilon^{\prime}}\right)^{2 k+1} r^{2}(s)^{-2 \alpha+2(k+q)}\left|\frac{\partial^{k} \varphi}{\partial \theta^{k}}(s)\right|^{2} \\
& +\frac{\varepsilon^{\prime 2 m-2 q}\left(1+2 \varepsilon^{\prime}\right)^{2 \beta+1}\left(1+\varepsilon^{\prime}\right)^{-2 \alpha+2 q-1}}{(2 m-2 q-1)(2 m-2 q)((m-q-1)!)^{2}} \\
& \left.\quad \times \int_{s}^{s_{1}}\left|\frac{\partial^{m-q} \varphi}{\partial \theta^{m-q}}(\tau)\right|^{2} r_{2}(\tau)^{-2 \beta-1} d \tau\right\}
\end{aligned}
$$

We integrate over $s, z^{\prime}$ and $\theta$ and obtain in an analogous manner to the proof in part $2^{0}$ :
$\int_{\partial \mathrm{S}} \int_{\mathrm{I}_{0}^{\prime}}|\varphi(y)|^{2} r_{2}(y)^{-2 \alpha+2 q-1} \mu_{\theta}(y) d y d \theta$

$$
\begin{array}{r}
\leqslant \omega_{n}\left(1+\varepsilon^{\prime}\right)^{2 \alpha-2 q+1}(m-q+1) \sum_{|j|=k \leqslant m-q-1} \frac{1}{(k!)^{2}(2 k+1)} \\
\times\left(\frac{\varepsilon^{\prime}}{1+\varepsilon^{\prime}}\right)^{2 k+1} \int\left|D_{j^{\prime} \rho}(x)\right|^{2} r_{2}(x)^{-2 \alpha+2(k+q)} d x \\
+\frac{\varepsilon^{\prime 2} 2 m-2 q\left(1+2 \varepsilon^{\prime}\right)^{2 \beta+1}(m-q+1)}{(2 m-2 q-1)(2 m-2 q)((m-q-1)!)^{2}} \omega_{n} \varepsilon^{\prime} \\
\times \sum_{|j|=m-q} \int_{\mathrm{U}^{\prime}}\left|D_{j} \rho(y)\right|^{2} r_{2}(y)^{-2 \beta} d y .
\end{array}
$$

Here we used again the fact that $\mu_{\theta}(y)<\varepsilon^{\prime} r_{2}(y)$. The lower bound for the left side is obtained as in part $2^{\circ}$. We sum up the inequalities for $\varphi=\mathrm{D}_{i} u$ over all indicial systems, with $|i|<m$ and arrive at (9.17).

Theorem III. $\left.-\operatorname{If}\left(\overline{\mathrm{D}}_{2}\right)^{0}=\mathrm{D}_{2}{ }^{(35}\right), \mathrm{U}_{\eta}=\mathrm{U}_{\eta}\left(\overline{\mathrm{D}}_{1}, \overline{\mathrm{D}}_{2}\right), u \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{U}_{\eta}^{+}\right)$, $\mathrm{J}_{\alpha, \mathrm{v}_{n}^{+}, \mathrm{D}_{2}}(u)<\infty$ and $\varphi$ is the singular multiplier corresponding to the triple $\left\{\mathrm{D}_{1}, \mathrm{D}_{2}, \eta / 2\right\}$ then $\varphi$ ¢ extended by 0 outside $\mathrm{U}_{\eta}^{+}$ is in $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ and

$$
\begin{equation*}
|\varphi u|_{\alpha, \mathrm{R}^{n}}^{2} \leqslant c\left(\mathrm{~J}_{\alpha, \mathrm{U}_{n}^{+}, \mathbf{D}_{\mathbf{2}}}(u)+|u|_{\alpha, \mathrm{U}_{n}^{+}}^{2}\right) \tag{9.22}
\end{equation*}
$$

«here $c$ depends only on $\alpha^{*}, \eta$, and $n$.
Proof. - Without further mention we will use the properties of the singular multiplier $q$ as given in Theorem III, $\S 8$ and we shall use $c$ as a generic constant which depends only on $\alpha^{*}$, $\eta$, and $n$.

By Theorem $\mathrm{I}, a)$ (with $\mathrm{D}_{1}=\mathrm{R}^{n}-\overline{\mathrm{D}}_{2}$ ) it is enough to prove the following three statements:

$$
\begin{align*}
& \varphi u \in \mathrm{P}_{1 \mathrm{loc}}^{\alpha}\left(\mathrm{R}^{n}-\overline{\mathrm{D}}_{2}\right),  \tag{9.23}\\
& \mathrm{J}_{\alpha, \mathrm{R}^{n}-\overline{\mathrm{D}}_{2}, \mathbf{D}_{\mathbf{2}}}(\varphi u) \leqslant c \mathrm{~J}_{\alpha, \mathrm{U}_{n, \mathbf{D}_{2}}}(u), \\
& |\varphi u|_{\alpha, \mathrm{R}^{n}-\overline{\mathrm{D}}_{\mathbf{2}}}^{2,} \leqslant c\left(\mathrm{~J}_{\alpha, \mathrm{v}_{n}^{+}, \mathbf{D}_{\mathbf{e}}}(u)+|u|_{\alpha, \mathrm{v}_{n}^{+}}^{2}\right) .
\end{align*}
$$

$\left.{ }^{(35}\right)$ This condition is needed to guarantee that if $D_{1}=R_{n}-\bar{D}_{2}$ then

$$
\left(\mathrm{D}_{1} \cup \mathrm{D}_{2} \cup\left(\partial \mathrm{D}_{1} \cap \partial \mathrm{D}_{2}\right)\right)^{0}=\mathrm{R}^{n},
$$

cf. Theorem I.

As before, we shall let $r_{1}(y)=r_{D_{1}}(y), r_{2}(y)=r_{D_{2}}(y), m=[\alpha]$ and $\beta=\alpha-m$.

Proof of (9.23). - If $x \in \mathrm{R}^{n}-\overline{\mathrm{D}}_{2}$ then there is a neighborhood of $x, \mathrm{~N}_{x}$, such that the ratio $\frac{r_{1}(y)}{r_{2}(y)}$ is either $>\eta / 2$ or $<\eta$ for $y \in \mathrm{~N}_{x}$. From the properties of $\varphi$ it is clear, then, that $\varphi u \in \mathrm{P}_{\text {loc }}^{\alpha}\left(\mathrm{R}^{n}-\overline{\mathrm{D}}_{2}\right)$.

Proof of (9.24). - Clearly it is sufficient to consider only points in $\mathrm{U}_{\eta}$. Let $|i| \leqslant m$ then (cf. (2.5) for the summation notation)

$$
\begin{aligned}
r_{2}(x)^{-2 \alpha+2|i|}\left|\mathrm{D}_{i}(\varphi u)\right|^{2} & \left.=\left(\sum_{j \cup k=i}\left(\mathrm{D}_{j} \varphi\right) r_{2}(x)^{|j|}\left(\mathrm{D}_{k} u\right) r_{2}(x)^{-\alpha+|k|}\right)\right)^{2} \\
& \leqslant \sum_{j \subset i}\left|\mathrm{D}_{j} \varphi\right|^{2} r_{2}(x)^{2|j|} \sum_{k \subset i}\left|\mathrm{D}_{k} u\right|^{2} r_{2}(x)^{-2 \alpha+2|k|}
\end{aligned}
$$

Since $\sum_{j \subset i}\left|\mathrm{D}_{j} \varphi\right|^{2} r_{2}(x)^{2|j|} \leqslant c,(9.24)$ is immediate.
Proof of (9.25). - Let $|i| \leqslant m$. By Prop. 6), § 2 and (9.24) we have

$$
\begin{align*}
\int_{\mathrm{R}^{n}-\overline{\mathrm{D}}_{\mathbf{q}}}\left|\mathrm{D}_{i}(\varphi u)\right|^{2} d x=\int_{r_{2}(x)<1} & +\int_{r_{2}(x)>1}  \tag{9.26}\\
& \leqslant \mathrm{~J}_{\alpha, \mathrm{U}_{n}, \mathbf{D}_{\mathbf{2}}}(\varphi u)+c|u|_{m, \mathrm{U}_{n}}^{2} \\
& \leqslant c\left(\mathrm{~J}_{\alpha, \mathrm{U}_{n}^{+}, \mathbf{D}_{\mathbf{2}}}(u)+|u|_{m, \mathrm{U}_{n}^{+}}^{+}\right)
\end{align*}
$$

If $\beta=0$ then (9.25) is immediate so we suppose $\beta>0$. Put $\gamma=\frac{\eta}{2(1+\eta)}$. Then (cf. (2.5) for the summation notation),
(9.27) $d_{\beta, \mathrm{R}^{n}-\overline{\mathbf{D}}_{\mathbf{g}}}\left(\mathrm{D}_{i}(\varphi u)\right)$

$$
\begin{aligned}
& \leqslant \frac{1}{\mathrm{C}(n, \beta)}\left[2 \int_{\mathrm{U}_{n}} \int_{\mathbf{R}^{n}-\overline{\mathrm{U}}_{n}} \frac{\left|\mathrm{D}_{i}(\varphi u)(x)\right|^{2}}{|x-y|^{n+2 \beta}} d y d x\right. \\
& +\int_{\mathrm{U}_{n}} \int_{\mathrm{U}_{n}}^{0} \frac{\left|\mathrm{D}_{i}(\varphi u)(x)-\mathrm{D}_{i}(\varphi u)(y)\right|^{2}}{|x-y|^{n+2 \beta}} d y d x \\
& +2^{\mid i++1} \int_{\mathrm{U}_{\mathrm{U}_{n}}(x)} \int_{|x-y|<\gamma \mathrm{U}_{n}(x)} \sum_{j \cup k=i} \frac{\left|\mathrm{D}_{k} u(y)\right|^{2}\left|\mathrm{D}_{j} \varphi(x)-\mathrm{D}_{j} \varphi(y)\right|^{2}}{|x-y|^{n+2 \beta}} d y d x \\
& \left.+2^{|i|+1} \int_{|x-y|<\gamma r_{2}(x)} \int_{\mathrm{U}_{n}} \int_{\mathrm{U}_{n}} \sum_{j \cup k=i} \frac{\left|\mathrm{D}_{j} \varphi(x)\right|^{2}\left|\mathrm{D}_{k} u(x)-\mathrm{D}_{k} u(y)\right|^{2}}{|x-y|^{n+2 \beta}} d y d x\right] .
\end{aligned}
$$

We denote the integrals by $I_{1}, I_{2}, I_{3}$, and $I_{4}$ respectively. If $x \in \mathrm{U}_{\eta / 2}$ and $|y-x|<\gamma r_{2}(x)$ then

$$
r_{1}(y) \leqslant r_{1}(x)+\gamma r_{2}(x)<(\eta / 2+\gamma) r_{2}(x)=\frac{\eta(2+\eta)}{2(1+\eta)} r_{2}(x)
$$

and $r_{2}(y) \geqslant r_{2}(x)-\gamma r_{2}(x)=\frac{2+\eta}{2(1+\eta)} r_{2}(x)$; hence $r_{1}(y)<\eta r_{2}(y)$ and :
(9.28) If $x \in \mathrm{U}_{\eta, 2}$ and $|x-y|<\gamma r_{2}(x)$ then $y \in \mathrm{U}_{\eta}$.

Since $\varphi u$ vanishes outside $U_{\eta / 2}$ it follows from (9.28), (9.26) and (9.24) that

$$
\begin{aligned}
& \mathrm{I}_{1} \leqslant \int_{\mathrm{U}_{r / /}}\left|\mathrm{D}_{i}(\varphi u)(x)\right|^{2} \int_{|x-y|>\gamma r_{i}(x)}|x-y|^{-n-2 \beta} d y d x \\
& \leqslant \frac{\gamma^{-2 \beta} \omega_{n}}{2 \beta}\left[\int_{\substack{\mathbf{U}_{n}, \mid(x)<1 \\
r_{2}(x)<1}}\left|\mathrm{D}_{i}(\varphi u)(x)\right|^{2} r_{2}(x)^{-2 \beta} d x\right. \\
& \left.+\int_{{\underset{r}{v_{r}(x)} \geqslant}^{r_{2}} \geqslant 1}\left|\mathrm{D}_{i}(\varphi u)(x)\right|^{2} d x\right] \\
& \leqslant \frac{c}{\beta}\left[\int_{\mathrm{U}_{\eta / 2}}\left|\mathrm{D}_{i}(\varphi u)(x)\right|^{2} r_{2}(x)^{-2 \alpha+2 i \mid i} d x+\int_{\mathrm{U}_{\eta / 2}}\left|\mathrm{D}_{i}(\varphi u)(x)\right|^{2} d x\right] \\
& \leqslant \frac{c_{1}}{\beta}\left(\mathrm{~J}_{\alpha, \mathrm{U}_{n}, \mathrm{D}_{s}}(u)+|u|_{m, \mathrm{U}_{n}}^{2}\right) .
\end{aligned}
$$

For $|x-y|>\gamma r_{2}(x)$ we have $|x-y|>\gamma\left(r_{2}(y)-|x-y|\right)$ or $|x-y|>\frac{\gamma}{1+\gamma} r_{2}(y)$ and in an analogous manner to the
above,

$$
\begin{aligned}
\mathrm{I}_{2} & \leqslant 2 \int_{\mathrm{U}_{\eta / /}}\left|\mathrm{D}_{i}(\varphi u)(x)\right|^{2} \int_{|x-y|>\gamma_{2}(x)}|x-y|^{-n-2 \beta} d y d x \\
& +2 \int_{\mathrm{U}_{n / /}}\left|\mathrm{D}_{i}(\varphi u)(y)\right|^{2} \int_{|x-y|>\frac{\gamma}{1+\gamma_{2}} r_{2}(y)}|x-y|^{-n-2 \beta} d x d y \\
& \leqslant \frac{c}{\beta}\left(\mathrm{~J}_{\alpha, \mathrm{U}_{r,}, \mathrm{D}_{2}}(u)+|u|_{m, \mathrm{U}_{\eta}}^{2}\right) .
\end{aligned}
$$

We note now two geometric properties immediately proved. (9.29) If $|x-y|<\gamma r_{2}(x)$ then $|x-y|<\gamma^{\prime} r_{2}(y)$ with

$$
\gamma^{\prime}=\frac{\eta}{2+\eta}
$$

(9.30) If $|x-y|<\gamma r_{2}(x)$ and $z$ lies in the segment $[x ; y]$ then $r_{2}(z) \geqslant \frac{2+\eta}{2(1+\eta)} r_{2}(x)$.

Evaluating $\left|\mathrm{D}_{j} \varphi(x)-\mathrm{D}_{j} \varphi(y)\right|$ for $|j| \leqslant m$ and $|x-y|<\gamma r_{2}(x)$ in terms of derivatives along the segment $[x ; y]$ we obtain from (9.30), $\left|\mathrm{D}_{j} \varphi(x)-\mathrm{D}_{j} \varphi(y)\right|^{2} \leqslant c|x-y|^{2} r_{2}(y)^{-2|j| \mid-2}$.

Therefore a typical term in $\mathrm{I}_{3}$ is majorated by (cf. (9.29))

$$
\begin{aligned}
& c \int_{\mathrm{U}_{n}}\left|\mathrm{D}_{k} u(y)\right|^{2} r_{2}(y)^{-2|j|-2} \int_{|x-y|<\gamma^{\gamma} r_{2}(y)}|x-y|^{-n+2-2 \beta} d x d y \\
& \quad \leqslant \frac{c_{1}}{1-\beta}\left[\int_{\mathrm{U}_{n}}\left|\mathrm{D}_{k} u\right|^{2} r_{2}(y)^{-2 \alpha+2|k|} d y+\int_{\mathrm{U}_{n}}\left|\mathrm{D}_{k} u\right|^{2} d y\right] .
\end{aligned}
$$

Consider now a typical term in $\mathrm{I}_{4}$ with $|k|<m$. Since $\varphi(x)=0$ outside of $\mathrm{U}_{\eta / 2}$ we can restrict $x$ to $\mathrm{U}_{\eta / 2}$ and majorate this term as follows :

$$
\begin{aligned}
& c \int_{|x-y| \ll r_{2}(x)} \int_{\mathrm{U}_{n}} r_{2}(x)^{-2|j|}\left(\frac{\gamma r_{2}(x)}{|x-y|}\right)^{1-\beta} \frac{\left|\mathrm{D}_{k} u(y)-\mathrm{D}_{k} u(x)\right|^{2}}{|x-y|^{n+2 \beta}} d y d x \\
& \quad=c_{1} \int_{\partial \mathrm{os}} \int_{\mathrm{E}_{6}\left(\mathrm{U}_{n / 2}\right.} \int_{\mathrm{r}(\theta, z)^{\prime}} r_{2}\left(z^{\prime}+s \theta\right)^{-2|j|+1-\beta} \\
& \quad \times \int_{s}^{s+\gamma r_{2}\left(z^{\prime}+s \theta\right)} \frac{\left|\mathrm{D}_{k} u\left(z^{\prime}+t \theta\right)-\mathrm{D}_{k} u\left(z^{\prime}+s \theta\right)\right|^{2}}{(t-s)^{2+\beta}} d t d s d z^{\prime} d \theta,
\end{aligned}
$$

where we have used the change of variables given in (4.1). Now since $|k|<m, \mathrm{D}_{k} u\left(z^{\prime}+t \theta\right)$ is absolutely continuous for almost all $\theta$ and $z^{\prime}$. By applying Hardy's inequality (9.14) to the integration with respect to $t$, then returning to the previous variables and using (9.29) we have the majoration

$$
\begin{aligned}
& c \int_{\left|x-\left|l_{2}\right|<r_{2}(x)\right.} \int_{2}(x)^{-2|j|+1-\beta}\left(\sum_{l=1}^{n}\left|\frac{\partial}{\partial y_{l}} \mathrm{D}_{k} u(y)\right|^{2}|x-y|^{-n+1-\beta} d y\right) d x \\
& \leqslant c_{1} \int_{\mathrm{U}_{n}} \sum_{l=1}^{n}\left|\frac{\partial}{\partial y_{l}} \mathrm{D}_{k} u(y)\right|^{2} r_{2}(y)^{-2|j|+1-\beta} \int_{|x-y|<\gamma^{\prime} r_{2}(y)}|x-y|^{-n+1-\beta} d x d y \\
& \leqslant \frac{c_{2}}{1-\beta} \sum_{l=1}^{n}\left[\left.\int_{r_{2}(y)<1}\left|\frac{\partial}{\partial y_{l}} \mathrm{D}_{k} u(y)^{2} r_{2}(y)^{-2 \alpha+2|k|+2} d y+\int_{r_{2}(y)>1}\right| \frac{\partial}{\partial y_{l}} \mathrm{D}_{k} u(y)\right|^{2} d y\right] .
\end{aligned}
$$

If in $\mathrm{I}_{4},|k|=m$, then the corresponding term is obviously majorated by $\mathrm{C}(n, \beta) d_{\beta, \mathrm{U}_{n}}\left(\mathrm{D}_{k} u\right)$ since $0 \leqslant \varphi(x) \leqslant 1$. Finally, we put all the majorations for the different terms on the right
hand side of (9.27) and obtain from (2.7) and (9.26),

$$
\left|\mathrm{D}_{i}(\varphi u)\right|_{,, \mathrm{R}^{n}-\overline{\mathbf{D}}_{z}}^{2} \leqslant c\left(\mathrm{~J}_{\alpha, \mathrm{U}_{n}^{+}, \mathbf{D}_{\mathbf{z}}}(u)+|u|_{\overline{\mathrm{\beta}}, \mathrm{U}_{n}^{+}}^{+}\right)
$$

from which (9.25) follows.
Remarks on spaces ̌ $^{\alpha, p}(\mathrm{D})$. For $1<p<\infty$, all theorems of this section are valid with standard changes in proofs. The expression $\mathrm{J}_{\alpha, \mathbf{D}_{1}, \mathbf{D}_{2}}(u)$ is now replaced by

$$
\begin{equation*}
\mathrm{J}_{\alpha, p, \mathrm{D}_{1}, \mathrm{D}_{\mathbf{2}}}(u)=\sum_{|i| \leqslant \alpha *} \int_{\mathrm{D}_{1}}|u(x)|^{\mid{ }^{p} r_{\mathbf{D}_{\mathbf{2}}}(x)^{-p(\alpha-\mid i)} d x .} \tag{9.31}
\end{equation*}
$$

The inequality of Lemma 3 is now replaced by

$$
\begin{align*}
& \mathrm{C} \int_{a}^{b}|u(x)-u(a)|^{p}(x-a)^{-p \alpha} d x<d_{\alpha, p,(a, b)}(u)  \tag{9.32}\\
& \equiv \frac{1}{\mathrm{C}(1, \alpha)} \int_{a}^{b} \int_{a}^{b} \frac{|u(x)-u(y)|^{p}}{|x-y|^{1+p a}} d x d y
\end{align*}
$$

for $\frac{1}{p}<\alpha<1$. The constant C is given by

$$
\mathrm{C}=\frac{2}{\mathrm{C}(1, \alpha)} \int_{0}^{1} \frac{\left(1-t^{\alpha-1 / p}\right)^{p}}{(1-t)^{1+p \alpha}} d t>\frac{2(\alpha-1 / p)^{p}}{p(1-\alpha) \mathrm{C}(1, \alpha)^{\prime}}
$$

Hardy's inequality (9.14) becomes now, for $\gamma>1 / p$

$$
\begin{align*}
& \int_{a}^{b}|f(s)-f(a)|^{p}(s-a)^{-p \gamma} d s  \tag{9.33}\\
& \quad \leqslant(\gamma-1 / p)^{-p} \int_{a}^{b}\left|f^{\prime}(s)\right|^{p}(s-a)^{-p \gamma+p} d s
\end{align*}
$$

In case $p=\infty$ all the theorems hold; their proofs can be shortened considerably. As usual, the corresponding expressions and formulas are obtained by taking $p$-th roots in case $p<\infty$ and putting $p \nearrow \infty$. This gives

$$
\mathrm{J}_{\alpha, \infty, \mathrm{D}_{1}, \mathrm{D}_{\mathbf{z}}}(u)=\max _{|i| \leqslant \alpha^{*}} \sup _{x \in \mathrm{D}_{1}}\left[\left|\mathrm{D}_{i} u(x)\right| r_{\mathrm{D}_{2}}(x)^{-\alpha+|i|}\right],
$$

$\sup _{a<x<b}\left[|u(x)-u(a)|(x-a)^{-\alpha}\right] \leqslant d_{\alpha, \infty(a, b)}(u)$

$$
\equiv \sup _{a<x, y<b}\left[|u(x)-u(y) \| x-y|^{\alpha}\right], \quad 0<\alpha<1
$$

$\sup _{a<s<b}\left[|f(s)-f(a)|(s-a)^{-\gamma}\right] \leqslant \gamma \sup _{a<s<b}\left[\left|f^{\prime}(s)\right|(s-a)^{-\gamma+1}\right], \quad \gamma>0$.
For $p=1$ the results are much less satisfactory. It can be stated as a general rule that each part of our theorems where the norm of $u$ is evaluated remains valid; however, where the
expression J is evaluated, the inequality is still valid for $\alpha$ non-integer but the constants obtained by our proofs converge to $\infty$ when $\alpha$ approaches an integer. This is due to the fact that Lemma 3 (inequality (9.32)) is not applicable because of the condition $1 / p<\alpha<1$ and that Hardy's inequality (9.33) is not valid for $\gamma=1=1 / p$. Thus, Theorem I, $a$ ) is valid whereas Theorem I, $b$ ) is not valid for $\alpha$ integer $\left({ }^{36}\right)$. Theorem II is valid for all $\alpha$; however our proof gives constants converging to $\infty$ when $\alpha$ approaches an integer from below (this may be the fault of the proof). Theorem III is valid without exceptions.

## 10. Extension theorems.

In this section we will describe procedures for the construction of rather general domains with extension theorems. We build them by putting together a finite or infinite number of domains for which the extension theorems hold. First we shall give a few definitions.

A closed (bounded or unbounded) set Q is called a $q$-cell (quasi-cell) if $\mathrm{Q}=\overline{\mathrm{Q}}^{\circ}$ and its interior $\overline{\mathrm{Q}}^{\circ}$ satisfies the ( C )-condition. The opening $x$ and radius $r$ of conoids involved in this condition will be called the ( C )-constants of Q . If G is any $(\mathrm{C})$-domain, then $\overline{\mathrm{G}}$ is a $q$-cell with interior which in general is larger than $G$.

To simplify notation we will often write ${ }^{\mathrm{P}}{ }^{\alpha}(\mathrm{Q})$ for ${ }^{\check{\mathrm{P}} \alpha}\left(\mathrm{Q}^{0}\right)$ and similarly for other classes defined for open sets.

We will be interested in systems $\left\{\mathrm{Q}_{k}\right\}$ of $q$-cells, finite or enumerable. The system is $\delta$-loose, $\delta>0$, if for any $k, l$, either $\mathrm{Q}_{k} \cap \mathrm{Q}_{l} \neq 0$ or $\operatorname{dist}\left(\mathrm{Q}_{k}, \mathrm{Q}_{l}\right) \geqslant 4 \delta$. The system is of rank $p<\infty$ if for every $k, \mathrm{Q}_{k} \cap \mathrm{Q}_{l} \neq 0$ for at most $p$ indices $l$. Obviously every finite system of bounded $q$-cells is loose and of finite rank.

It is clear that for a loose system $\left\{Q_{k}\right\}$ of finite rank, $\bigcup_{k} Q_{k}$ is a closed set. We will want it to be a $q$-cell, and for this we need a uniformity condition. We say that the system $\left\{\mathrm{Q}_{k}\right\}$

[^5]is uniform if it is loose, of finite rank and the ( C )-constants of all $\mathrm{Q}_{k}$ 's have uniform positive lower bounds. These lower bounds are the $(\mathrm{C})$-constants of $\bigcup_{k} \mathrm{Q}_{k}$ which is then a $q$-cell. For a uniform system $\left\{\mathrm{Q}_{k}\right\}$, the looseness-constant $\delta$, the rank $p$ and the lower bounds for the ( C )-constants of the $\mathrm{Q}_{k}$ are called the uniformity constants of the system. Obviously again, every finite system of bounded $q$-cells is uniform. We also note that if $\left\{\mathrm{Q}_{k}\right\}$ is a uniform system then
$$
\left|\partial\left(\cup \mathrm{Q}_{k}\right)\right|=\left|\cup \partial \mathrm{Q}_{k}\right|=0 .
$$

For a given uniform system $\left\{\mathrm{Q}_{k}\right\}$ we define the star $\sigma_{k}$ of $\mathrm{Q}_{k}$ as $\sigma_{k}=\left(\bigcup_{Q_{i} \mathrm{O}_{k} \neq 0} \mathrm{Q}_{l}\right)^{0}$ and the $\delta$-star $\mathrm{U}_{k}$ ( $\delta$ being the loosenessconstant of the system) as $\mathrm{U}_{k}=\sigma_{k} \cup \mathrm{~S}\left(\mathrm{Q}_{k}, 2 \delta\right)\left({ }^{37}\right)$. Clearly $\mathrm{Q}_{k}^{\circ} \subset \sigma_{k}$ and

1) $\left\{\mathrm{U}_{k}\right\}$ is a $\delta$-loose open covering of $\bigcup_{l} \mathrm{Q}_{l}$ of rank $p^{3}$ ( $p$ being the rank of $\left\{\mathrm{Q}_{k}\right\}$ ); $\mathrm{U}_{k} \cap\left(\cup \mathrm{Q}_{l}\right)^{0}=\sigma_{k}$.

We can now state our first theorem.
Theorem I. - Let $\left\{\mathrm{Q}_{k}\right\}$ be a uniform system of $q$-cells. Denote $\mathrm{D}_{k}=\mathrm{Q}_{k}^{\circ}$ and let $u_{k} \in \mathrm{P}^{\alpha}\left(\mathrm{D}_{k}\right)$. In order that there exist a simultaneous extension $\tilde{u} \in \mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ for all the $u_{k}$ 's it is necessary and sufficient that there exist for each $u_{k}$ an extension $\tilde{u}_{k} \in \mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ such that

$$
\text { (10.1a) } \quad \sum_{k}\left|\tilde{u}_{k}\right|_{\alpha, \mathrm{B}^{n}}^{2}<\infty \quad \text { and } \quad \sum_{\substack{k, l \\ Q_{k} Q_{l} \neq 0}} \mathrm{~J}_{\alpha, \mathrm{D}_{k}, \mathrm{D}_{l}}\left(u_{k}-\tilde{u}_{l}\right)<\infty .
$$

If $\tilde{u}$ is given then the $\tilde{u}_{k}$ 's can be chosen explicitly as linear expressions in $\tilde{u}$ so that

$$
\begin{equation*}
\sum_{k}\left|\tilde{u}_{k}\right|_{\alpha, \mathrm{R}^{n}}^{2}+\sum_{\substack{k, l \\ \mathrm{Q}_{k} \cap \mathrm{Q}_{l} \neq 0}} \mathrm{~J}_{\alpha, \mathrm{D}_{k}, \mathrm{D}_{l}}\left(u_{k}-\tilde{u}_{l}\right) \leqslant c^{\prime}|\tilde{u}|_{\alpha, \mathrm{R}^{n}}^{2} . \tag{10.1b}
\end{equation*}
$$

If the $\tilde{u}_{k}$ 's are given, then a $\dot{u}$ can be constructed explicitly as a linear expression in the $\tilde{u}_{k}$ 's with
(10.1c) $\quad|\tilde{u}|_{\alpha, \mathrm{R}^{n}}^{2} \leqslant c^{\prime \prime}\left[\sum_{k}\left|\tilde{u}_{k}\right|_{\alpha, \mathrm{R}^{n}}^{2}+\sum_{\substack{k, l \\ \mathrm{Q}_{k} \cap \mathrm{Q}_{l} \neq 0}} \mathrm{~J}_{\alpha, \mathrm{D}_{k}, \mathrm{D}_{l}}\left(u_{k}-\tilde{u}_{l}\right)\right]$.
${ }^{\left({ }^{7}\right)} \mathrm{S}(\mathrm{E}, \delta)=[x: \operatorname{dist}(x, \mathrm{E})<\delta]$.

The constants $c^{\prime}$ and $c^{\prime \prime}$ depend only on $n, \alpha^{*}$ and the uniformity constants of $\left\{\mathrm{Q}_{k}\right\}$.

Proof. - $1^{0}$ Suppose that $\tilde{u}$ exists. Denote by $\tau_{k}(x)$ the function constructed in Lemma 1, § 1 which is in $\mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right)$, is $=1$ on $\mathrm{S}\left(\mathrm{Q}_{k}, \frac{\delta}{2}\right)$ and $=0$ outside of $\mathrm{S}\left(\mathrm{Q}_{k}, \delta\right)$. We put

$$
\begin{equation*}
\tilde{u}_{k}=\tau_{k} \tilde{u} . \tag{10.2}
\end{equation*}
$$

By Prop. 7), § 2, we have $\left|\tilde{u}_{k}\right|_{\alpha, \mathrm{R}^{n}}^{2} \leqslant c|\tilde{u}|_{\alpha, \mathrm{s}\left(\rho_{k}, 2 \hat{)},\right.}^{2}, c$ depending only on $\alpha^{*}, n$, and $\delta$. Furthermore, on $\mathrm{D}_{k}$,

$$
u_{k}(x)-\tilde{u}_{l}(x)=\left(1-\tau_{l}(x)\right) \tilde{u}(x)
$$

and since $1-\tau_{l}$ is a multiplier of order $\alpha^{*}$ whose Lipschitz constant depends only on $n, \alpha^{*}$ and $\delta$, and $1-\tau_{l}$ vanishes for $r_{\mathrm{D}_{l}}(x)<\delta / 2$ we have by Prop. 6), $\S 2$

$$
\begin{aligned}
& \mathrm{J}_{\alpha, \mathbf{D}_{k}, \mathbf{v}_{l}}\left(u_{k}-\tilde{u}_{l}\right)=\mathrm{J}_{\alpha, \mathbf{D}_{k}, \mathbf{D}_{l}}\left(\left(1-\tau_{l}\right) \tilde{u}\right) \leqslant\left(\frac{\delta}{2}\right)^{-2 \alpha}\left|\left(1-\tau_{l}\right) \tilde{u}\right|_{m, \mathbf{D}_{k}}^{2} \\
& \leqslant c_{1}\left(\frac{\delta}{2}\right)^{-2 \alpha}|\tilde{u}|_{m, \mathbf{D}_{k}}^{2},
\end{aligned}
$$

$c_{1}$ depending only on $n, \alpha^{*}$ and $\delta$. Thus

$$
\sum_{\substack{k \\ Q_{k} \cap Q_{l} \neq 0}} \mathrm{~J}_{\alpha, \mathrm{D}_{k}, \mathrm{D}_{l}}\left(u_{k}-\tilde{u}_{l}\right) \leqslant p c_{1}\left(\frac{\delta}{2}\right)^{-2 \alpha}|\tilde{u}|_{m, U_{l}}^{2},
$$

and by Prop. 1)

$$
\left.\begin{aligned}
& \sum_{k}\left|\tilde{u}_{k}\right|_{\alpha, \mathrm{R}^{n}}^{2}+\underset{\substack{k, l \\
\mathrm{Q}_{k} \mathrm{Q}_{l} \neq 0}}{ } \mathrm{~J}_{\alpha, \mathrm{D}_{k}, \mathbf{D}_{l}}\left(u_{k}-\tilde{u}_{l}\right) \\
&
\end{aligned} \quad \leqslant p^{3}\left(p c_{1}\left(\frac{\delta}{2}\right)^{-2 \alpha}+c\right) \right\rvert\, \tilde{u}_{\alpha, \mathrm{R}^{n}}^{2}, ~ l
$$

which proves (10.1b).
$2^{0}$ Suppose now that the $\tilde{u}_{k}$ 's exist. Fix an index $k$ and consider all indices $l$ such that $\mathrm{Q}_{k} \cap \mathrm{Q}_{l} \neq 0$. Let these indices be $l_{1}<l_{2}<\ldots<l_{q}, q \leqslant p$ ( $k$ is among these indices). We construct successively functions $\varphi_{1}, \varphi_{2}, \ldots, \varphi_{q}$ all in $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$, the function $\varphi_{i}$ being a simultaneous extension of all $u_{l_{j}}$ with $j \leqslant i$. We put $\varphi_{1}=\tilde{u}_{l_{1}}$. Suppose that $\varphi_{i}$ is already constructed for $i<q$. If $\mathrm{D}_{l_{i+1}} \subset \bigcup_{j=1}^{i} \mathrm{Q}_{l j}$, we can obviously
put $\varphi_{i+1}=\varphi_{i}$ since $\partial Q_{l}$ has measure 0 and $u_{l_{i+1}}=u_{l_{j}}$ on $\mathrm{D}_{l_{i+1}} \cap \mathrm{D}_{l_{j}}$ (in view of (10.1a)). If now $\mathrm{D}_{l_{i+1}} \nsubseteq \bigcup_{j=1} \mathrm{Q}_{l_{j}}$ we
proceed as follows. We notice first that

$$
\begin{aligned}
& \mathrm{J}_{\alpha, \mathbf{D}_{l_{i+1}},} \bigcup_{j \leqslant i} \mathrm{D}_{l_{j}}\left(\tilde{u}_{l_{i+1}}-v_{i}\right) \leqslant \sum_{j=1}^{i} \mathrm{~J}_{\alpha, \mathrm{D}_{l_{i+1}}, \mathbf{D}_{l j}}\left(\tilde{u}_{l_{i+1}}-\varphi_{i}\right) \\
& \quad \leqslant 2 \sum_{j=1}^{i}\left[\mathrm{~J}_{\alpha, \mathrm{D}_{l_{i+1}}} \mathbf{D}_{\mathrm{l}_{j}}\left(u_{l_{i+1}}-\tilde{u}_{l_{j}}\right)+\mathrm{J}_{\alpha, \mathrm{D}_{i+1}, \mathbf{D}_{l j}}\left(\tilde{u}_{l_{j}}-\varphi_{i}\right)\right] .
\end{aligned}
$$

By Theorem I, b), § 9,

$$
\mathrm{J}_{\alpha, \mathbf{D}_{l+1+1}, \mathbf{D}_{l j}}\left(\tilde{u}_{t j}-\varphi_{i}\right) \leqslant \mathrm{J}_{\alpha, \mathbf{R}^{n}, \mathbf{D}_{l j}}\left(\tilde{u}_{t j}-\varphi_{i}\right) \leqslant c\left|\tilde{u}_{i j}-\varphi_{i}\right|_{\alpha, \mathbf{R}^{n}}^{2},
$$

and hence $\mathrm{J}_{\alpha, \mathrm{D}_{l_{i+1}}} \bigcup_{j \leq i} \mathrm{D}_{i_{j}}\left(\tilde{u}_{l_{i+1}}-s_{i}\right)<\infty$. Applying now Theorems II and III of $\S 9$, and using the singular multiplier $\varphi_{i}$ corresponding to the triple $\left\{\mathrm{Q}_{l_{i+1}}, \bigcup_{j=1}^{i} \mathrm{Q}_{l_{j}}, 1 / 26\right\}\left({ }^{37}\right)$ we
can put

$$
\begin{equation*}
\varphi_{i+1}=\varphi_{i}\left(\tilde{u}_{l_{i+1}}-\varphi_{i}\right)+\varphi_{i} . \tag{10.3}
\end{equation*}
$$

The function $\varphi_{q}$ will be denoted $\rho^{(k)}$. It is easy to check by following the inductive definition of the $\varphi_{i}$ 's and using the evaluations in Theorems Ib), II, and III, § 9 that

$$
\left|\rho^{(k)}\right|_{\alpha, \mathrm{R}^{n}}^{2} \leqslant c_{1}\left[\sum_{i=1}^{q}\left|\tilde{u}_{l_{i}}\right|_{\alpha, \mathrm{R}^{n}}^{2}+\sum_{1 \leqslant j<i \leqslant q} \mathrm{~J}_{\alpha, \mathrm{D}_{i_{i}} \mathbf{D}_{l_{j}}}\left(u_{l_{i}}-\tilde{u}_{\left.l_{j}\right)}\right]\right]
$$

with $c_{1}$ depending only on $n, \alpha^{*}$, and the uniformity constants of $\left\{Q_{k}\right\}$. In the second sum there might be terms corresponding to $\mathrm{Q}_{l_{i}} \cap \mathrm{Q}_{l_{j}}=0$. Such a term can obviously be majorated by $\left(1+(4 \delta)^{-2 \alpha}\right) 2\left(\left|\tilde{u}_{l_{i}}\right|_{\alpha, \mathrm{R}^{n}}^{2}+\left|\tilde{u}_{l_{j}}\right|_{\alpha, \mathrm{R}^{n}}^{2}\right)$. Replacing $c_{1}$ by

$$
c_{2}=c_{1}\left[1+2 p\left(1+(4 \delta)^{-2 \alpha}\right)\right]
$$

we can write

$$
\begin{equation*}
\left|\rho^{(k)}\right|_{\alpha, \mathrm{R}^{n}}^{2} \leqslant c_{2}\left[\sum_{\substack{l} \varrho_{k} \neq 0}\left|\tilde{u}_{|c|}^{2}\right|_{\alpha, \mathrm{R}^{n}}^{2}+\Sigma \mathrm{J}_{\alpha, \mathrm{D} l^{\prime}, \mathrm{D} l^{\prime}}\left(u_{l^{\prime}}-\tilde{u}_{l^{\prime}}\right)\right], \tag{10.4}
\end{equation*}
$$

$\left.{ }^{(37}\right)$ We choose $\eta=1$ in Theorem II, $\S 9$, hence $\varepsilon=1 / 13$ and in Theorem III the multiplier corresponds to $\left\{\mathrm{Q}_{l_{i+1}}, \bigcup_{j=1}^{i} \mathrm{Q}_{l_{j}}, 1 / 26\right\}$.
the last sum extended over all indices $l^{\prime}, l^{\prime \prime}$, with $\mathrm{Q}_{l^{\prime}} \cap \mathrm{Q}_{l^{\prime \prime}} \neq 0$, $\mathrm{Q}_{l^{\prime}} \cap \mathrm{Q}_{k} \neq 0$ and $\mathrm{Q}_{l^{\prime}} \cap \mathrm{Q}_{k} \neq 0$.

We now take the partition of unity $\psi_{k}$ corresponding to the $\delta$-loose covering $\left\{\mathrm{U}_{k}\right\}$ with rank $p^{3}$ of $\bigcup_{k} \mathrm{Q}_{k}$ (see Lemma 2, §5) and form

$$
\begin{equation*}
\tilde{u}=\sum_{k} \psi_{k^{\prime}}{ }^{(k)} . \tag{10.5}
\end{equation*}
$$

Since for $x \in \mathrm{D}_{t}, \psi_{k}(x)=0$ except when $\mathrm{Q}_{l} \cap \mathrm{Q}_{k} \neq 0$ and then $\rho^{(k)}(x)=u_{l}(x)$ by construction, $\tilde{u}$ is an extension of $u_{l}$ for every $l$. We obtain by using Prop. 1),

$$
\begin{aligned}
\mid \tilde{u}_{\alpha, \mathrm{R}^{n}}^{2} \leqslant & 2 p^{3} \\
& \sum_{k}\left|\psi_{k^{\prime}}{ }^{(k)}\right|_{\alpha, \mathrm{R}^{n}}^{2} \leqslant 2 p^{3} c \sum_{k}\left|\rho^{(k)}\right|_{\alpha, \mathrm{R}^{n}}^{2} \\
& \left.\leqslant 2 p^{3} c c_{2}\left[p \sum_{l}\left|\tilde{u}_{l}\right|_{\alpha, \mathrm{R}^{n}}^{2}+p \sum_{\mathrm{Q}^{\prime} \cap \mathrm{M}_{l^{\prime \prime}} \neq 0} \mathrm{~J}_{\alpha, \mathrm{D}_{l}^{\prime}, \mathrm{D}_{l^{\prime \prime}}\left(u_{l^{\prime}}\right.}-\tilde{u}_{l^{\prime \prime}}\right)\right]
\end{aligned}
$$

where $c$ depends only on $n, \alpha^{*}$ and $\delta$, hence (10.1c). The inductive definition of the $\rho^{(k)}$ 's (see (10.3)) and formula (10.5) show, finally, that $\tilde{u}$ is linear in the $\tilde{u}_{k}{ }^{\prime}$ s.

Remark 1. - In the subsequent theorems of this section we shall use Theorem I to construct extension theorems for domains which are unions of $q$-cells. To formalize this construction let $\left\{\mathrm{Q}_{k}\right\}$ be a uniform system of $q$-cells such that $\mathrm{Q}_{k}^{\circ} \in \mathscr{E}(\mathrm{I})$ and $\mathrm{D}=\left(\bigcup_{k} \mathrm{Q}_{k}\right)^{\circ}$. Let $\mathrm{E}_{k}$ be the linear extension mapping defined on $\mathscr{D}_{\mathrm{E}_{k}} \subset \mathfrak{M r}\left(\mathrm{Q}_{k}^{0}\right)$ into $\mathfrak{M r}\left(\mathrm{R}^{n}\right)$ and

$$
\mathscr{D}_{\mathrm{E}}=\left\{u: u \in \operatorname{Mr}(\mathrm{D}),\left.u\right|_{Q_{k}^{\circ}} \in \mathscr{D}_{\mathbb{E}_{k}} \text { for all } k\right\} .
$$

(Cf. the proof of Theorem II, §7). Clearly $\bigcup_{\alpha \in \mathrm{I}}{ }^{\mathrm{P}} \alpha(\mathrm{D}) \subset \mathscr{D}_{\mathrm{E}}$ and $\mathscr{D}_{\mathrm{E}}$ is a linear space. We set $u_{k}=\left.u\right|_{\mathrm{Q}_{k}}, \tilde{u}_{k}=\mathrm{E}_{k} u_{k}$ and $\mathrm{E} u=\tilde{u}$ as given by (10.3) and (10.5). Eu so defined gives a linear extension mapping of $\mathscr{D}_{\mathrm{E}}$ into $\mathfrak{m}\left(\mathrm{R}^{n}\right)$, i.e. this mapping satisfies condition (7.1a). However, additional conditions have to be imposed on the system $\left\{\mathrm{Q}_{k}\right\}$ in order to guarantee that condition (7.1b) be satisfied.

Theorem II. - Let $\left\{\mathrm{Q}_{k}\right\}$ be a uniform system of $q$-cells such that $\mathrm{Q}_{k}^{\circ}$ and $\left(\mathrm{Q}_{k} \cup \mathrm{Q}_{l}\right)^{\circ}$ for $\mathrm{Q}_{k} \cap \mathrm{Q}_{l} \neq 0$ belong to $\mathscr{E}(\mathrm{I}, \Gamma)$. Then $\mathrm{D}=\left(\bigcup_{k} \mathrm{Q}_{k}\right)^{\circ} \in \dot{E}(\mathrm{I}, c \Gamma) \quad$ where $c \equiv c\left(\mathrm{I}^{\prime}\right) \equiv c\left(\left[\alpha_{1}, \alpha_{2}\right]\right)$ is a function only of $\alpha_{2}^{*}, n$, and the uniformity constants of the system.

Proof. - Let E be the mapping given in Remark 1. Then if $\mathrm{I}^{\prime}=\left[\alpha_{1}, \alpha_{2}\right] \subset \mathrm{I}, \alpha \in \mathrm{I}^{\prime}$ and $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$, it follows that (in the notation of Remark 1)

$$
\Sigma\left|\tilde{u}_{k}\right|_{\alpha, \mathrm{B}^{\mathrm{n}}}^{2} \leqslant \Gamma\left(\mathrm{I}^{\prime}\right)^{2} \Sigma\left|u_{k}\right|_{\alpha, Q_{k}^{\circ}}^{2} \leqslant 2 p \Gamma\left(\mathrm{I}^{\prime}\right)^{2}|u|_{\alpha, \mathrm{D}}^{2} .
$$

If $u_{k, l}$ is the restriction of $u$ to $\left(\mathrm{Q}_{k} \cup \mathrm{Q}_{l}\right)^{0}$ for $\mathrm{Q}_{k} \cap \mathrm{Q}_{l} \neq 0$, let $\tilde{u}_{k, l} \in \mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ be the extension of $u_{k, l}$ with

$$
\left.\left|\tilde{u}_{k,}\right|_{\alpha, \mathrm{R}^{n}} \leqslant \Gamma\left(\mathrm{I}^{\prime}\right)\left|u_{k, l}\right|_{\alpha,\left(Q_{k} \cup Q\right)}\right)^{\circ}
$$

Then by Theorem $1, b), \S 9$,

$$
\begin{aligned}
\mathrm{J}_{\alpha, Q_{k}^{\circ}, Q_{l}^{0}\left(u_{k}-\tilde{u}_{l}\right)} & =\mathrm{J}_{\alpha, \mathrm{Q}_{k}^{\circ}, \mathrm{Q}_{l}^{0}\left(\tilde{u}_{k, l}-\tilde{u}_{l}\right)} \\
& \leqslant \mathrm{J}_{\alpha, \mathrm{R}^{n}, \mathrm{Q}_{l}^{\mathrm{o}}}\left(\tilde{u}_{k, l}-\tilde{u}_{l}\right) \leqslant c\left|\tilde{u}_{k, l}-\tilde{u}_{l}\right|_{\alpha, \mathbf{R}^{n}}^{2} \\
& \leqslant 2 c \Gamma\left(I^{\prime}\right)^{2}\left[\left|u_{k, l}\right|_{\alpha,\left(Q_{k} \cup Q_{l}\right)^{\circ}}^{2}+|u|_{\alpha, Q_{l}^{i}}^{2}\right]
\end{aligned}
$$

where $c$ depends only on $\alpha_{2}^{*}, n$ and the uniformity constants. Hence by Prop. 1),

$$
\begin{aligned}
\left.\sum_{\substack{k, l \\
\mathrm{Q}_{k} \cap \mathrm{Q}_{l} \neq 0}} \mathrm{~J}_{\alpha, \mathrm{Q}_{k}^{\circ}, \mathrm{Q}_{l}^{\mathrm{o}}\left(u_{k}\right.}-\tilde{u}_{l}\right) & \leqslant 2 c \Gamma\left(\mathrm{I}^{\prime}\right)^{2} \sum_{l}\left[2 p|u|_{\alpha, \sigma_{l}}^{2}+p|u|_{\alpha, \mathrm{Q}_{l}^{0}}^{2}\right] \\
& \leqslant 4 c \Gamma\left(\mathrm{I}^{\prime}\right)^{2}\left(2 p^{4}+p^{2}\right)|u|_{\alpha, \mathbf{D}}^{2} .
\end{aligned}
$$

and the proof is completed by (10.1c).
For our next theorem we must introduce some additional definitions.

For two closed non-empty sets $\mathrm{F}_{1} \neq \mathrm{F}_{2}$ we define the slope $\omega \equiv \omega\left(\mathrm{F}_{1}, \mathrm{~F}_{2}\right)=\omega\left(\mathrm{F}_{2}, \mathrm{~F}_{1}\right)$ as follows

$$
\begin{equation*}
\omega=\omega\left(\mathrm{F}_{1}, \mathrm{~F}_{2}\right)=\inf _{x \notin \mathrm{~F}_{\mathrm{H}_{4}} \cap \mathrm{~F}_{\mathbf{t}}} \frac{r_{\mathrm{F}_{\mathbf{t}}}(x)+r_{\mathrm{F}_{\mathbf{t}}}(x)}{\min \left(1, r_{\mathrm{F}_{4} \cap \mathrm{~F}_{\mathbf{t}}}(x)\right)} . \tag{10.6}
\end{equation*}
$$

When $\omega=0, \mathrm{~F}_{1}$ and $\mathrm{F}_{2}$ are said to be tangential, otherwise non-tangential.

If $F_{1} \cap F_{2}=0$ then $\omega\left(F_{1}, F_{2}\right)=\operatorname{dist}\left(F_{1}, F_{2}\right)$. From this definition we deduce the following useful facts.
2) If $\mathrm{F}_{1}$ and $\mathrm{F}_{2}$ are tangential then at least one of the tspo statements is true: a) There exists a sequence $\left\{x^{(k)}\right\} \subset \mathrm{F}_{1}$ such that $\left|x^{(k)}\right| \rightarrow \infty, r_{\mathrm{F}_{\mathbf{t}}}\left(x^{(k)}\right) \rightarrow 0$ and $r_{\mathrm{F}_{\mathbf{t}}}\left(x^{(k)}\right) / r_{\mathrm{F}_{\mathbf{t}} \cap \mathrm{F}_{\mathbf{t}}}\left(x^{(k)}\right) \rightarrow 0$; b) there exists a sequence $\left\{x^{(k)}\right\} \subset \mathrm{F}_{1}$ such that

$$
x^{(k)} \rightarrow x^{(0)} \in \mathrm{F}_{1} \cap \mathrm{~F}_{2} \quad \text { and } \quad r_{\mathrm{F}_{\mathbf{t}}}\left(x^{(k)}\right) / r_{\mathrm{F}_{\mathbf{t}} \cap \mathrm{P}_{\mathfrak{z}}}\left(x^{(k)}\right) \rightarrow 0 .
$$

3) If $\mathrm{F}_{1}$ and $\mathrm{F}_{2}$ are non-tangential then: a) for $x \in \mathrm{~F}_{1}$ and $r_{\mathrm{F}_{2}}(x)<\omega, r_{\mathrm{F}_{2}}(x) \leqslant r_{\mathrm{F}_{4} \cap \mathrm{~F}_{2}}(x) \leqslant \frac{1}{\omega} r_{\mathrm{F}_{\mathbf{2}}}(x) ;$ b) for $x \in \mathrm{~F}_{1}$ and $r_{\mathrm{F}_{1} \cap \mathrm{~F}_{2}}(x) \geqslant 1, r_{\mathrm{F}_{2}}(x) \geqslant \omega$.

A system $\left\{\mathrm{Q}_{k}\right\}$ of $q$-cells is called regular if $1^{0}$ it is uniform, $2^{0}$ there is an $\omega_{0}, 0<\omega_{0} \leqslant 1$, such that for any distinct $Q_{k}$ and $\mathrm{Q}_{l}$ with $\mathrm{Q}_{k} \cap \mathrm{Q}_{l} \neq 0, \omega\left(\mathrm{Q}_{k}, \mathrm{Q}_{l}\right) \geqslant \omega_{0}$ and $3^{\circ}$ for every $y \in \partial\left(\cup \mathrm{Q}_{k}\right)$ there exist arbitrarily small neighborhoods $\mathrm{V}_{y}$ such that $\mathrm{V}_{y} \cap\left(\cup \mathrm{Q}_{k}\right)^{0}$ is connected (i.e. the boundary $\partial\left(\cup \mathrm{Q}_{k}\right)$ does not cut locally $\left.\left(\cup Q_{k}\right)^{\circ}\right)$. The uniformity-constants of $\left\{\mathrm{Q}_{k}\right\}$, together with the bound $\omega_{0}$ will be called the regularity constants of the system $\left(^{(38)}\right.$.

Two $q$-cells are called adjacent if their intersection is at least ( $n-1$ )-dimensional.

Theorem III. - Let $\left\{\mathrm{Q}_{k}\right\}$ be a regular system such that $\mathrm{Q}_{k}^{o} \in \mathscr{E}(\mathrm{I}, \Gamma), \quad k=1,2, \ldots$, and $\left(\mathrm{Q}_{k} \cup \mathrm{Q}_{l}\right)^{\circ} \in \mathcal{E}(\mathrm{I}, \Gamma)$ for all couples of adjacent $q$-cells. Then $\mathrm{D}=\left(\cup \mathrm{Q}_{k}\right)^{0} \in \mathcal{E}(\mathrm{I}, c \Gamma)$ where $c \equiv c\left(\mathrm{I}^{\prime}\right) \equiv c\left(\left[\alpha_{1}, \alpha_{2}\right]\right)$ depends only on $\alpha_{2}^{*}, n$, and the regularity constants of $\left\{\mathrm{Q}_{k}\right\}$.

Remark 2. - We do not know of any union of two intersecting $q$-cells with an extension theorem for $\alpha \geqslant 1$, where the $q$-cells are non-adjacent or tangential; in fact, if $n$ is odd, and $\mathrm{D}_{1}$ and $\mathrm{D}_{2}$ are arbitrary open sets such that $\left(\overline{\mathrm{D}}_{1} \cup \overline{\mathrm{D}}_{2}\right)^{\circ} \in \mathscr{E}(\mathrm{I})$ with $(n+1) / 2 \in I$ then it can be shown that $\omega\left(\overline{\mathrm{D}}_{1}, \overline{\mathrm{D}}_{2}\right) \geqslant c / \Gamma$ where $c, 0<c \leqslant 2 / 3$, depends only on $n$ and $\Gamma$ is the extension constant of D for $\alpha=(n+1) / 2$. Furthermore, if $\partial \mathrm{D}$ cuts D locally, it can be shown that if $\mathrm{D} \in \mathcal{E}(\mathrm{I})$ then $\mathrm{I} \subset\left[\begin{array}{ll}0, & n / 2]\end{array}\right.$ (and we do not know of any domain which does have an extension theorem for $1 \leqslant \alpha \leqslant n / 2$ if $\partial \mathrm{D}$ cuts D locally). This indicates that conditions $2^{\circ}$ and $3^{\circ}$ in the definition of a regular system are essentially necessary for the validity of Theorem III and that in practice Theorem III is stronger than Theorem II.

Proof of Theorem III. - We will need a topological lemma. We introduce first the notion of a chain: a sequence $\mathrm{Q}_{l_{0}}, \mathrm{Q}_{l_{l}}, \ldots, \mathrm{Q}_{l_{i}}$ is a chain connecting $\mathrm{Q}_{l_{0}}$ with $\mathrm{Q}_{l_{i}}$ if any two consecutive $q$-cells are adjacent.

[^6]Lemma 1. - In a regular system $\left\{\mathrm{Q}_{k}\right\}$ for any $y \in \mathrm{Q}_{k^{\prime}} \cap \mathrm{Q}_{k^{\prime \prime}}$ there exists a chain $\mathrm{Q}_{l_{0}}, \mathrm{Q}_{l_{1}}, \ldots, \mathrm{Q}_{l_{i}}, l_{0}=k^{\prime}, l_{i}=k^{\prime \prime}$ such that $y \in \mathrm{Q}_{l_{j}}, j=0,1, \ldots, i$.

Proof. - Consider the class $\Lambda_{y}$ of all $\mathrm{Q}_{k}^{\prime} \mathrm{s}$ containing $y$. Obviously $\Lambda_{y}$ contains at most $p q$-cells. For two $\mathrm{Q}_{k}^{\prime} \mathrm{s}$ to be connected by a chain in $\Lambda_{y}$ is an equivalence relation. We claim that there is only one equivalence class in $\Lambda_{y}$. In fact, suppose that there is more than one, and let $\Lambda^{\prime}$ be one such class. Put

$$
\begin{array}{ll}
\overline{\mathrm{G}}_{1}=\bigcup_{\mathrm{Q}_{1} \in \Lambda^{\prime}} \mathrm{Q}_{k}, & \overline{\mathrm{G}}_{2}=\bigcup_{\mathrm{Q}_{k} \in \Lambda_{y} y^{-}} \mathrm{Q}_{k}, \\
\mathrm{G}_{1}=\left(\overline{\mathrm{G}}_{1}\right)^{\circ} \neq 0, & \mathrm{G}_{2}=\left(\overline{\mathrm{G}}_{2}\right)^{\circ} \neq 0 .
\end{array}
$$

Obviously $\overline{\mathrm{G}}_{1} \cap \overline{\mathrm{G}}_{2}$ is of dimension $<n-1$. Since $\left\{\mathrm{Q}_{k}\right\}$ is a regular system we can find a small neighborhood $\mathrm{V}_{y}$ of $y$ such that $\mathrm{V}_{y} \cap\left(\cup \mathrm{Q}_{k}\right)^{\circ}$ is connected and also that

$$
\begin{aligned}
& \left(\mathrm{V}_{y} \cap \mathrm{G}_{1}\right) \cup\left(\mathrm{V}_{y} \cap \mathrm{G}_{2}\right) \subset \mathrm{V}_{y} \cap\left(\cup \mathrm{Q}_{k}\right)^{0} \\
& \quad=\mathrm{V}_{y} \cap\left(\overline{\mathrm{G}}_{1} \cup \overline{\mathrm{G}}_{2}\right)^{\circ} \subset\left(\mathrm{V}_{y} \cap \mathrm{G}_{1}\right) \cup\left(\mathrm{V}_{y} \cap \mathrm{G}_{2}\right) \cup\left(\mathrm{V}_{y} \cap \overline{\mathrm{G}}_{1} \cap \overline{\mathrm{G}}_{2}\right) .
\end{aligned}
$$

$\left(V_{y} \cap G_{1}\right)$ and ( $V_{y} \cap G_{2}$ ) being non empty and disjoint this would mean that the open connected set $\mathrm{V}_{y} \cap\left(\cup \mathrm{Q}_{k}\right)^{0}$ is disconnected by an at most ( $n-2$ )-dimensional closed set $\overline{\mathrm{V}}_{y} \cap \overline{\mathrm{G}}_{1} \cap \overline{\mathrm{G}}_{2}$ which is impossible. Thus the lemma is proved.

Consider any $\mathrm{Q}_{k^{\prime}}$ and $\mathrm{Q}_{k^{\prime}}$ with $\mathrm{Q}_{k^{\prime}} \cap \mathrm{Q}_{k^{\prime \prime}} \neq 0$. If we restrict ourselves only to minimal chains $\Gamma$ connecting $\mathrm{Q}_{k^{\prime}}$ with $\mathrm{Q}_{k^{\prime \prime}}$ (i.e. such that there is no chain $\Gamma^{\prime} \subset \Gamma$ of smaller length connecting $\mathrm{Q}_{k^{\prime}}$ with $\mathrm{Q}_{k^{\prime}}$ it is clear that there are at most $2^{p}$ minimal chains $\Gamma$ connecting $\mathrm{Q}_{k^{\prime}}$ with $\mathrm{Q}_{k^{\prime \prime}}$ and satisfying $\bigcap_{\mathrm{Q}_{l} \in \Gamma} \mathrm{Q}_{l} \neq 0$. Number
them $\Gamma^{1}, \ldots, \Gamma^{\mathrm{y}}, \mathrm{N} \leqslant 2^{p}$ and put

$$
\begin{equation*}
\mathrm{F}^{q}=\bigcap_{\mathrm{Q}_{\iota} \in \Gamma^{q}} \mathrm{Q}_{l}, \quad q=1,2, \ldots, \mathrm{~N}, \quad \mathrm{~F}^{q} \neq 0 . \tag{10.8}
\end{equation*}
$$

Obviously, by Lemma 1

$$
\begin{equation*}
\mathrm{Q}_{k^{\prime}} \cap \mathrm{Q}_{k^{\prime}}=\bigcup_{q=1}^{\mathrm{N}} \mathrm{~F}^{q} . \tag{10.9}
\end{equation*}
$$

Let $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D}), \alpha \in \mathrm{I}^{\prime}=\left[\alpha_{1}, \alpha_{2}\right] \subset \mathrm{I}$ and $\tilde{u}=\mathrm{E} u$ as given in Remark 1. We use the notation of Remark 1 and in addition denote by $\tilde{u}_{k, l}$ the extension of $\left.u\right|_{\left(Q_{k} \cup Q\right)^{\circ}}$ for $\mathrm{Q}_{k}$ and $\mathrm{Q}_{l}$ adjacent as given in the hypotheses of the theorem.

We shall prove for $Q_{k^{\prime}}$ and $Q_{k^{\prime}}$ for which $Q_{k^{\prime}} \cap Q_{k^{\prime}} \neq 0$ that ( $\sigma_{k}$ being the star of $\mathrm{Q}_{k}$ )
(10.10) $\quad \mathrm{J}_{\alpha, 0_{k^{\prime}}^{\circ}, \circ_{k^{\prime}}^{\circ}}\left(u-\tilde{u}_{k^{\prime}}\right) \leqslant \omega_{0}^{-2 \alpha}\left(2+16 p^{2} 2^{p} c\right) \Gamma\left(\mathrm{I}^{\prime}\right)^{2}|u|_{\alpha, \sigma_{k^{\prime}}}^{2}\left({ }^{39}\right)$ where $c$ depends only on $\alpha_{2}^{*}$, $n$, and the uniformity constants of the system. Thus by (10.1c) and Prop. 1)

$$
\begin{aligned}
|\tilde{u}|_{\alpha, \mathrm{R}^{n}}^{2} \leqslant c^{\prime \prime} \Gamma\left(\mathrm{I}^{\prime}\right)^{2}[ & \left.\sum_{k}|u|_{\alpha, \mathrm{Q}_{k}^{\circ}}^{2}+p \omega_{0}^{-2 \alpha}\left(2+16 p^{2} 2^{p} c\right) \sum_{k^{\prime}}|u|_{\alpha, \sigma_{k}}^{2}\right] \\
& \leqslant 2 c^{\prime \prime} \Gamma\left(\mathrm{I}^{\prime}\right)^{2}\left[p+p^{4} \omega_{0}^{-2 \alpha}\left(2+16 p^{2} 2^{p} c\right)\right]|u|_{\alpha, \mathrm{D}}^{2} .
\end{aligned}
$$

which will complete the proof.
We pass now to the proof of (10.10). In the following we shall use the expression $\mathrm{J}_{\alpha, \mathrm{D}, \mathrm{F}}(\varphi)$ when F is not necessarily an open set and also the notation of (10.8) and (10.9).

By virtue of condition $2^{\circ}$ of regular systems, Prop. 3a) and (10.9) we have

$$
\begin{aligned}
& \text { (10.11a) } \mathrm{J}_{\alpha, \mathrm{Q}_{k}^{\circ}, \mathrm{Q}_{k^{\circ}}}\left(u-\tilde{u}_{k^{*}}\right)
\end{aligned}
$$

Let $\mathrm{Q}_{l_{0}}, \mathrm{Q}_{l_{i}}, \ldots, \mathrm{Q}_{l_{i}}, l_{0}=k^{\prime}, l_{i}=k^{\prime \prime}, i \leqslant p-1$ be the chain ${ }^{q}$. Then

$$
\begin{aligned}
& \mathrm{J}_{\alpha, Q_{0}^{\circ}, F^{q}}\left(u-\tilde{u}_{i-1}^{k^{\prime}}\right)=\mathrm{J}_{\alpha, \mathrm{Q}_{k^{\circ}}^{\circ}, \mathrm{F}^{q}}\left(\tilde{u}_{b_{0}}-\tilde{u}_{t_{i}}\right) \\
& \leqslant p \sum_{j=0}^{i=1} \mathrm{j}_{\alpha=1}^{i-1} \mathrm{o}_{k_{k}^{0}, \mathrm{~F}^{q}}\left(\tilde{u}_{l_{j}}-\tilde{u}_{l_{j+1}}\right) \\
& \leqslant 2 p \sum_{\substack{j=0 \\
i=1}}\left[\mathrm{~J}_{\alpha, \mathrm{o}_{k^{\circ}, \mathrm{F}^{q}}}\left(\tilde{u}_{l_{j}}-\tilde{u}_{l, l_{j+1}}\right)+\mathrm{J}_{\alpha, \mathrm{Q}_{k}^{\circ}, \mathrm{F}^{q}( }\left(\tilde{u}_{l_{j+1}}-\tilde{u}_{l_{l, l_{j+1}}}\right)\right] \\
& \leqslant 2 p \sum_{j=0}\left[\mathrm{~J}_{\alpha, \mathrm{R}^{n}, Q_{i j}^{0}}\left(\tilde{u}_{l_{j}}-\tilde{u}_{l, l_{j+1}}\right)+\mathrm{J}_{\alpha, \mathrm{R}^{n}, Q_{i_{j+1}}}\left(\tilde{u}_{l_{j+1}}-\tilde{u}_{l, l_{j+1}}\right)\right] .
\end{aligned}
$$

Applying Theorem I $b$ ), $\S 9$ to the square bracketed terms we have by the hypotheses of our theorem

$$
\begin{aligned}
& \mathrm{J}_{\alpha, \mathrm{Q}_{k^{\prime}}^{\mathbf{o}}, \mathrm{F}^{q}}\left(u-\tilde{u}_{k^{\prime}}\right) \leqslant 2 p c \sum_{j=0}^{i=1}\left[\left|\tilde{u}_{l_{j}}-\tilde{u}_{l_{j, ~}, l_{j+1}}\right|_{\alpha, \mathbf{R}^{n}}^{2}+\left.\left|\tilde{u}_{l_{j+1}}-\tilde{u}_{l_{j}, l_{j+1}}\right|\right|_{\alpha, \mathbf{R}^{n}} ^{2}\right] \\
& \leqslant 16 p c \Gamma\left(\mathrm{I}^{\prime}\right)^{2} \sum_{j=0}^{i-1}|u|_{\alpha,\left(Q_{l_{j}} \cup\right.}^{2} \mathrm{Q}_{\mathrm{Q}_{j+1}}{ }^{\infty} \\
& \leqslant 16 p^{2} c \Gamma\left(\mathrm{I}^{\prime}\right)^{2}|u|_{\alpha, \sigma_{k}}^{2},
\end{aligned}
$$

$\left({ }^{39}\right)$ We assume without loss of generality that $\omega_{0} \leqslant 1$.
where $c$ depends only on $\alpha_{2}^{*}, n$ and the uniformity constants of the system.

Combining the above with (10.11a) and (10.11b) we get (10.10) and the proof is complete.

The next theorem and its corollary aim at replacing in Theorem III the condition $\left(\mathrm{Q}_{k} \cup \mathrm{Q}_{l}\right)^{\circ} \in \mathscr{E}(\mathrm{I}, \Gamma)$ for adjacent $q$-cells by a geometric property of the couple of cells.

Theorem IV. - Let $\mathrm{D}_{1}$ and $\mathrm{D}_{2}$ be such that $\overline{\mathrm{D}}_{1} \cap \overline{\mathrm{D}}_{2} \neq 0$, $\overline{\mathrm{D}}_{1}^{0}=\mathrm{D}_{1}, \overline{\mathrm{D}}_{2}^{0}=\mathrm{D}_{2}$ and $\omega \equiv \omega\left(\overline{\mathrm{D}}_{1}, \overline{\mathrm{D}}_{2}\right)>0$ and let

$$
\mathrm{D}=\left(\overline{\mathrm{D}}_{1} \cup \overline{\mathrm{D}}_{2}\right)^{0}
$$

Suppose that one of the following two conditions holds:
a) $\overline{\mathrm{D}}_{1}$ and $\overline{\mathrm{D}}_{1} \cap \overline{\mathrm{D}}_{2}$ are $q$-cells;
b) there is an L-convex domain G such that

$$
\overline{\mathrm{D}}_{1} \cap \overline{\mathrm{D}}_{2} \subset \overline{\mathrm{G}} \subset \overline{\mathrm{D}}_{1} \cup \overline{\mathrm{D}}_{2}
$$

and $\overline{\mathrm{D}}_{1}, \overline{\mathrm{D}}_{2}, \overline{\mathrm{D}}_{1} \cap \overline{\mathrm{G}}$ and $\overline{\mathrm{D}}_{2} \cap \overline{\mathrm{G}}$ are $q$-cells.
If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and $\left.u\right|_{\mathrm{D}_{k}}$ has an extension $\tilde{u}_{k} \in \mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right), k=1,2$, then $u$ has an extension $\tilde{u}$ in $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ which depends linearly on $\tilde{u}_{1}$ and $\tilde{u}_{2}$ and satisfies

$$
\begin{equation*}
|\tilde{u}|_{\alpha, \mathrm{R}^{n}}^{2} \leqslant c_{\alpha}\left[\left|\tilde{u}_{1}\right|_{\alpha, \mathrm{R}^{n}}^{2}+\left|\tilde{u}_{2}\right|_{\alpha, \mathrm{R}^{n}}^{2}+|u|_{\alpha, \mathrm{D}}^{2}\right] . \tag{10.12}
\end{equation*}
$$

In case a) $c_{\alpha}$ depends only on $\omega, n, \alpha^{*}$, and the $(\mathrm{C})$-constants of $\overline{\mathrm{D}}_{1}$ and $\overline{\mathrm{D}}_{1} \cap \overline{\mathrm{D}}_{2}$; in case b) $c_{\alpha}$ depends only on $\omega, n, \alpha^{*}$, the (C)-constants of $\overline{\mathrm{D}}_{1}, \overline{\mathrm{D}}_{2}, \overline{\mathrm{D}}_{1} \cap \overline{\mathrm{G}}$ and $\overline{\mathrm{D}}_{2} \cap \overline{\mathrm{G}}$ and the L-convexity constants of G .

This theorem has as an immediate consequence.
Corollary I. - If $\mathrm{D}_{1}$ and $\mathrm{D}_{2}$ satisfy the hypotheses of Theorem IV either in case a) or case b) and in addition $\mathrm{D}_{1}$ and $\mathrm{D}_{2}$ are in $\mathcal{E}(\mathrm{I}, \Gamma)$ then $\mathrm{D}=\left(\overline{\mathrm{D}}_{1} \cup \overline{\mathrm{D}}_{2}\right)^{0} \in \mathcal{E}\left(\mathrm{I}, c^{\prime} \Gamma\right)$ where $c^{\prime}\left(\mathrm{I}^{\prime}\right) \equiv c^{\prime}\left(\left[\alpha_{1}, \alpha_{2}\right]\right)=\left(3 \max c_{\alpha}\right)^{1 / 2} \quad$ and $\quad c_{\alpha}$ is the constant of Theorem IV.

Proof of Theorem $I V$. - Let $\omega_{0}=\min (1, \omega)$. a) Since $\tilde{u}_{1}-\tilde{u}_{2}$ vanishes in $\mathrm{D}_{1} \cap \mathrm{D}_{2}$ we have by Prop. 3 (and noting that $\left.r_{\overline{\mathrm{D}}_{\mathbf{N}} \cap \overline{\mathrm{D}}_{\mathbf{2}}}(x)=r_{\left(\overline{\mathrm{D}}_{\mathbf{N}} \cap \overline{\mathrm{D}}_{2}\right)^{\circ}}(x)=r_{\mathrm{D}_{\mathbf{1}} \cap \mathrm{D}_{\mathbf{z}}}(x)\right)$,
$\mathrm{J}_{\alpha, \mathrm{D}_{1}, \mathrm{D}_{2}}\left(\tilde{u}_{1}-\tilde{u}_{2}\right) \leqslant \omega_{0}^{-2 \alpha}\left[\left|\tilde{u}_{1}-\tilde{u}_{2}\right|_{\alpha, \mathrm{D}_{1}}^{2}+\mathrm{J}_{\alpha, \mathrm{D}_{1}, \mathrm{D}_{1} \cap \mathrm{D}_{\mathbf{2}}}\left(\tilde{u}_{1}-\tilde{u}_{2}\right)\right]$
and by Theorem $\mathrm{I} b), \S 9$,

$$
\mathrm{J}_{\alpha, \mathrm{D}_{1}, \mathrm{D}_{1} \cap \mathrm{D}_{\mathbf{x}}}\left(\tilde{u}_{1}-\tilde{u}_{2}\right) \leqslant \mathrm{J}_{\alpha, \mathrm{R}^{n}, \mathrm{D}_{1} \cap \mathrm{D}_{\mathbf{2}}}\left(\tilde{u}_{1}-\tilde{u}_{2}\right) \leqslant c\left|\tilde{u}_{1}-\tilde{u}_{2}\right|_{\alpha, \mathrm{R}^{n}}^{2}
$$

Thus if $\mathscr{H}$ is the singular multiplier corresponding to the triple $\left\{D_{1}, D_{2}, 1 / 26\right\}$ we have by Theorems II and III of $\S 9\left({ }^{\left({ }^{40}\right)}\right.$ that $\tilde{u}=\varphi\left(\tilde{u}_{1}-\tilde{u}_{2}\right)+\tilde{u}_{2}$ is an extension of $u$, is in $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ and by an application of the bounds in the cited theorems satisfies (10.12) ( ${ }^{41}$ ) which proves $a$ ).
b) Sinces $u-\tilde{u}_{2}$ vanishes on $\mathrm{G} \cap \mathrm{D}_{2}$ (and $\tilde{u}_{1}-\tilde{u}_{2}=u-\tilde{u}_{2}$ on $G \cap D_{1}$ ) we have by Theorem $\left.\mathrm{I} b\right), \S 9$,

$$
\mathrm{J}_{\alpha, \mathrm{G} \cap \mathrm{D}_{\mathbf{1}}, \mathrm{G} \cap \mathrm{D}_{\mathbf{2}}}\left(\tilde{u}_{1}-\tilde{u}_{2}\right) \leqslant \mathrm{J}_{\alpha, \mathrm{G}, \mathrm{G} \cap \mathrm{D}_{\mathbf{2}}}\left(u-\tilde{u}_{2}\right) \leqslant c\left|u-\tilde{u}_{2}\right|_{\alpha, \mathrm{G}}^{2}
$$

Therefore if $\varphi_{1}$ is the singular multiplier corresponding to the triple $\left\{G \cap D_{1}, G \cap D_{2}, 1 / 26\right\}$ we have by Theorems II and III of $§ 9$ that $\varphi_{1}=\varphi_{1}\left(\tilde{u}_{1}-\tilde{u}_{2}\right)+\tilde{u}_{2}$ is in $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$, is an extension of $\left.u\right|_{\mathrm{G}}$ and satisfies $\left|\varphi_{1}\right|_{\alpha, \mathrm{R}^{n}}^{2} \leqslant c\left[\left|\tilde{u}_{1}\right|_{\alpha, \mathrm{R}^{n}}^{2}+\left|\tilde{u}_{2}\right|_{\alpha, \mathrm{R}^{n}}^{2}+|u|_{\alpha, \mathrm{D}}^{2}\right]$.

Thus with the couple $D_{1}$ and $G$ we are in case $a$ ) ( ${ }^{42 \text { ) }}$ and obtain an extension $\varphi_{2}$ of $\left.u\right|_{\left(\bar{G} \cup \bar{D}_{1}\right)}$ to $\mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$. Now with the couple $D_{2}$ and $\left(\bar{G} \cup \bar{D}_{1}\right)^{\circ}$ we again are in case $\left.a\right)$ and obtain finally the required extension. The bound in (10.12) is obtained by applying the bounds of the cited theorems and case $a$ ). This completes the proof of Theorem IV.

Another useful result for applications is :
Corollary II. - If $\mathrm{Q}_{1}$ and $\mathrm{Q}_{2}$ are intersecting $q$-cells in $\mathscr{E}(\mathrm{I}, \Gamma)$ and $\mathrm{D}=\left(\mathrm{Q}_{1} \cup \mathrm{Q}_{2}\right)^{\circ}$ is L -convex then $\mathrm{D} \in \mathscr{E}(\mathrm{I}, c \Gamma)$ where $c\left(\mathrm{I}^{\prime}\right) \equiv c\left(\left[\alpha_{1}, \alpha_{2}\right]\right)$ depends only on $n, \alpha_{2}^{*}$, the $(\mathrm{C})$-constants of $\mathrm{Q}_{1}$ and $\mathrm{Q}_{2}$, and the L-convexity constants of D .

Proof. - If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and in the first paragraph of the proof of Theorem IV, b) we replace $G \cap D_{1}, G \cap D_{2}$ and $G$ by $\mathrm{Q}_{1}^{0}, \mathrm{Q}_{2}^{0}$ and D respectively, then $s_{1}$ is the desired extension ${ }^{\left({ }^{43}\right)}$. It is to be noticed that this part of the proof of Theorem IV $b$ ) does not need the hypothesis $\omega\left(\overline{\mathrm{D}}_{1}, \overline{\mathrm{D}}_{2}\right)>0$.
$\left.{ }^{(40}\right)$ We choose $\eta=1$ in Theorem II. Thus in Theorem III, $\eta / 2=1 / 26$.
(41) The term $|u|_{\alpha, D}^{2}$ on the right side of (10.12) may be omitted in this case.
${ }^{\left({ }^{42}\right)}$ We use here the easily proved fact that if $F_{1}, F_{2}$, and $F_{3}$ are closed sets satisfying $0 \neq F_{1} \cap F_{2} \subset F_{3} \subset F_{1} \cup F_{2}$ then $\omega\left(F_{3}, F_{1}\right) \geqslant \frac{1}{2} \omega\left(F_{2}, F_{1}\right)$.
$\left.{ }^{(43}\right)$ This corollary can be considered as a special case of Corollary I by virtue of the easily proved lemma : if $F_{1}$ and $F_{2}$ are closed sets such that $\left(F_{1} \cup F_{2}\right)^{0}$ is L-convex with L-convexity constants $\delta, p$, and M , then $\omega\left(\mathrm{F}_{1}, \mathrm{~F}_{2}\right) \geqslant \frac{1}{2} \min \left(\delta, \mathrm{M}^{-2}\right)$.

We finish this section by giving a simple extension theorem for orders $\alpha<1$.

Theorem V. - Let $0 \leqslant \alpha_{1} \leqslant \alpha_{2}<1$. If $\left\{\mathrm{Q}_{k}\right\}$ is a uniform system and each $\mathrm{Q}_{k}$ is in $\varepsilon\left[\alpha_{1}, \alpha_{2}\right]$ then also $\left(\bigcup \mathrm{Q}_{k}\right)^{\circ} \in \mathscr{E}\left[\alpha_{1}, \alpha_{2}\right]$.

The proof follows immediately from Theorem I since for $\alpha<1$, Lemma 1 b ), § 9 allows the majorations of
$c$ depending only on $n$ and the $(\mathrm{C})$-constants of $\mathrm{Q}_{l}$.
Remarks on spaces $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D})$. - Since the results of the present section are based on those of section 9 , all of them are valid for $1<p \leqslant \infty$ when $\mathrm{P}^{\alpha}(\mathrm{D}), \quad \mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$, and $\mathcal{E}(\mathrm{I}, \Gamma)$ are replaced by $\check{\mathrm{P}}^{\alpha, p}(\mathrm{D}), \check{\mathrm{P}}^{\alpha, p}\left(\mathrm{R}^{n}\right)$ and $\mathscr{E}(p)(\mathrm{I}, \Gamma)$ respectively (see the corresponding remarks at the end of sections 7 and 9 ).

For $p=1$ the situation is more complicated in view of the exceptions mentioned at the end of $\S 9$. The extension mapping defined in Remark 1 of the present section gives still a simultaneous extension for all non-integral $\alpha$, but for $\alpha$ integer ${ }^{\text {P }}{ }^{\alpha, 1}(\mathrm{D})$ will not in general be transformed into $\mathrm{P}^{\alpha, 1}\left(\mathrm{R}^{n}\right)$ under the hypotheses of Theorems II or III. Furthermore there will be uniform extension constants only for closed intervals $I^{\prime}$ which do not contain any integer.

## 11. The generalized Lichtenstein extension.

In $\S 3$ we introduced the Lichtenstein reflection of order $q<\infty$ across a hyperplane. We mentioned also that quite recently R. T. Seeley [11] defined a Lichtenstein reflection of order $\infty$ across a hyperplane. Using Seeley's basic idea we will define a Lichtenstein reflection of infinite order across a Lipschitzian graph. This will allow us to obtain corresponding simultaneous extensions for the whole infinite interval $0 \leqslant \alpha<\infty$ for SLG-domains and then, by localization, to LG-domains (see § 8 for definition).

To define the reflection of infinite order we put in (3.1) $h_{\mu}=2^{\mu+2}-1, \mu=0, \ldots, q$, and obtain by (3.2) the corres-
ponding coefficients $a_{\mu}(q)$. One sees immediately that for $q \rightarrow \infty,(-1)^{\mu} a_{\mu}(q) \nearrow(-1)^{\mu} a_{\mu}$, where
(11.1a) $0<(-1)^{\mu} a_{\mu}=\prod_{\sigma=1}^{\infty} \frac{1}{1-2^{-\sigma}} \prod_{\nu=1}^{\mu} \frac{1}{1-2^{-\nu}} 2^{-\mu(\mu+1) / 2}$

$$
<2^{4} 2^{-\mu(\mu+1) / 2} .
$$

We set

$$
\begin{equation*}
b_{\mu}=h_{\mu}+1=2^{\mu+2}, \quad \mu=0,1, \ldots \tag{11.1b}
\end{equation*}
$$

The equations (3.1) transform then into $\sum_{\mu=0}^{q} a_{\mu}(q) b_{\mu}^{p}=1$ or 0 depending on whether the integer $p=0$ or $0<p \leqslant q$. Going to the limit $q \rightarrow \infty$ (which is obviously permissible) we get immediately

| (11.1c) | $\sum_{\mu=1}^{\infty} a_{\mu}=1, \quad \sum_{\mu=1}^{\infty} a_{\mu} b_{\mu}^{p}=0$ | for | $p=1,2,3, \ldots$ |
| :--- | :--- | :--- | :--- |
| (11.1d) | $\sum_{\mu=0}^{\infty}\left\|a_{\mu}\right\| b_{\mu}^{p} \leqslant 2^{8} 2^{p(p+3) / 2}$ | for | $p \geqslant 0$. |

Consider now a Lipschitzian function $f$ with positive lower bound and with Lipschitz constant $\mathrm{M} \geqslant 1$ defined on a rectangle $\mathrm{B} \subset \mathrm{R}^{n-1}, \mathrm{~B}=\left[a_{k}<x_{k}<b_{k}, k=1, \ldots, n-1\right]$. It is well known that there exist Lipschitzian extensions $\tilde{f}$ of $f$ to the whole of $\mathrm{R}^{n-1}$ with the same lower bound and the same Lipschitz constant. We fix a standard procedure assigning to every $f$ a well-determined $\tilde{f}\left({ }^{44}\right)$. We set then
(11.2a) $\rho(x)$ is the regularized distance of Theorem II, § 8 corresponding to the domain $\left[x: x_{n}<\tilde{f}\left(x^{\prime}\right)\right]$ with the choice of $\varepsilon=1 / 2$.

$$
\left\{\begin{array}{l}
\mathrm{D}=\left[x: x^{\prime} \in \mathrm{B}, x_{n}<f\left(x^{\prime}\right)\right],  \tag{11.2b}\\
\tilde{\mathrm{D}}=\left[x: x^{\prime} \in \mathrm{B}\right], \\
\mathrm{D}_{+}=\left[x: x^{\prime} \in \mathrm{B}, x_{n}>f\left(x^{\prime}\right)\right], \\
\mathrm{G}=\left[x: x^{\prime} \in \mathrm{B}, x_{n}=f\left(x^{\prime}\right)\right], \\
\lambda=\min \left(1,\left(b_{k}-a_{k}\right) \text { for } k=1, \ldots, n-1\right) .
\end{array}\right.
$$

(44) Such a standard procedure would be the one applied in the proof of Prop. 2, § 3, by using successively simple reflections (of order $q=0$ with $h_{0}=1$ ) across all the faces of $B$. We obtain thus an extension $\tilde{f}^{(1)}$ of $f$ to a rectangle $\tilde{B}^{(1)} \supset B$. Repeating this process we get successively $\tilde{f^{(1)}}, \tilde{f^{(2)}}, \ldots$, defined on $\tilde{\mathbf{B}}^{(\mathbf{1})} \subset \tilde{\mathbf{B}}^{(\mathbf{2})} \subset \ldots$ with $\mathbf{R}^{n-1}=U \tilde{\mathbf{B}}^{(k)}$.

The quantity $\lambda$ introduced above is called the minimal width of the rectangle $B$.

Consider now functions $u \in \operatorname{mr}(\mathrm{D})$ such that
(11.2c) For some $d<0, u(x)=0$ if $x_{n}<d$ (d depending on $u$ ).

For such functions we define

$$
\left\{\begin{align*}
& \tilde{u}(x)= u^{\prime}(x) \quad \text { for } \quad x \in \mathrm{D},  \tag{11.2d}\\
& \tilde{u}(x)=\sum_{\mu=0}^{\infty} a_{\mu} u\left(x^{\prime}, x_{n}-b_{\mu} \rho(x)\right) \text { for } x \in \mathrm{D}_{+} \text {where- } \\
& \quad \text { er it is defined, } \\
& \tilde{u}(x)= \text { correction of } \tilde{u}\left(\text { as defined above in } \mathrm{D} \cup \mathrm{D}_{+}\right) \\
& \quad \text { for } x \in \mathrm{G} \text { wherever the correction exists. }
\end{align*}\right.
$$

The function $\tilde{u}$ restricted to $\mathrm{D}_{+}$is the Lichtenstein reflection of order $\infty$ of $u$ across the Lispchitzian graph G.
By Theorem II, § $8, \frac{\partial}{\partial x_{n}}\left(x_{n}-b_{\mu \rho}(x)\right) \leqslant 1-\frac{1}{2} b_{\mu}<-1$; hence, if $x=\left(x^{\prime}, x_{n}\right) \in \mathrm{D}_{+}$then the points $\left(x^{\prime}, x_{n}-b_{\mu, p}(x)\right)$ are in D for all $\mu$. Furthermore, in view of (11.2c),

$$
u\left(x^{\prime}, x_{n}-b_{\mu \mathrm{p}}(x)\right) \neq 0
$$

for at most a finite number of $\mu^{\prime} s$. Therefore (11.2d) is defined a.e. and $\tilde{u} \in \mathscr{M r}(\tilde{\mathrm{D}})$.

Let $\psi(x) \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right), \quad 0 \leqslant \psi(x) \leqslant 1, \psi(x)=0$ for $x_{n} \leqslant-2$ and $\psi(x)=1$ for $x_{n} \geqslant-1$. Then we define the generalized Lichtenstein extension by

$$
\begin{equation*}
\mathrm{E}: \mathfrak{m r}(\mathrm{D}) \rightarrow \mathfrak{m r}(\tilde{\mathrm{D}}), \quad \mathrm{E} u=(1-\psi) u+\widetilde{\psi} \tag{11.3}
\end{equation*}
$$

where $(1-\psi) u$ is extended by 0 in $\tilde{D}-\mathrm{D}$.
Our basic result in this section is
Theorem I. - If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ then $\mathrm{E} u \in \check{\mathrm{P}}^{\alpha}(\tilde{\mathrm{D}})$ and

$$
|\mathrm{E} u|_{\alpha, \tilde{\mathrm{D}}} \leqslant c \lambda^{-\beta} \mathrm{M}^{\alpha+n+3 / 2}|u|_{\alpha, \mathbf{D}}
$$

where $\beta=\alpha-[\alpha]$ and $c$ depend only on $\alpha^{*}$ and $n$.
Since D is obviously a G-domain, Prop. 3), § 6 implies that $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$ restricted to D is dense in $\mathrm{P}^{\alpha}(\mathrm{D})$; hence by the functional space property of $\check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and $\check{\mathrm{P}}^{\alpha}(\tilde{\mathrm{D}})$ it is sufficient to consider only such restrictions for the proof of our theorem. It follows that it is enough to prove

Theorem $\mathrm{I}^{\prime}$. - If $u$ is the restriction of a function in $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$ to D then a) $\left.\tilde{u} \in \mathrm{C}^{\infty}(\tilde{\mathrm{D}}) ; b\right)|\tilde{u}|_{\alpha, \tilde{\mathrm{D}}} \leqslant c \lambda^{-\beta} \mathrm{M}^{\alpha+n+3 / 2}|u|_{\alpha, \mathrm{D}}$ where $\boldsymbol{c}$ depends only on $\alpha^{*}$ and $n$.

In fact, if Theorem I' is true and $u$ is a restriction of a function in $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$ then $\psi u$ is also such a function and by Prop. 6, $\S 2$ and the present theorem

$$
|\widetilde{\psi u}|_{\alpha, \tilde{\mathrm{D}}} \leqslant \mathrm{C} \lambda-\beta \mathrm{M}^{\alpha+n+3 / 2}|u|_{\alpha, \mathrm{D}}
$$

with C depending only on $\alpha^{*}$ and $n$. On the other hand, since $(1-\psi) u$ vanishes in $\tilde{D}$ for $x_{n} \geqslant-1$ we get, by applying again Prop. 6, §2, and putting $m=[\alpha], \beta=\alpha-m$,

$$
|(1-\psi) u|_{\alpha, \tilde{\mathrm{D}}}^{2} \leqslant|(1-\psi) u|_{\alpha, \mathrm{D}}^{2}+\frac{\omega_{n}}{\beta \mathrm{C}(n, \beta)}|(1-\psi) u|_{m, \mathbf{D}}^{2} \leqslant \mathrm{C}_{1}|u|_{\alpha, \mathbf{D}}^{2}
$$

and finally $|\mathrm{E} u|_{\alpha, \mathrm{D}} \leqslant c \lambda^{-\beta} \mathrm{M}^{\alpha+n+3 / 2}|u|_{\alpha, \mathrm{D}}$ giving the statement of Theorem I for such functions $u$.

From now on till the end of the proof of Theorem I', $u$ will be a restriction to D of a function in $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$. An inspection of the series (11.2d) giving $\tilde{u}(x)$ for $x \in \mathrm{D}_{+}$shows that for $x$ in a compact $K \subset D_{+}$the series contains only a finite number of non-vanishing terms, this number depending on the distance from K to G (and not on $x$ in K ). It follows that $\tilde{u}$ is in $\mathrm{C}^{\infty}\left(\mathrm{D} \cup \mathrm{D}_{+}\right)$.

We establish next a formula for derivatives $\mathrm{D}_{i} \tilde{u}(x), x \in \mathrm{D}_{+}$.
Let $y_{l}^{(\mu)}(x)=x_{l}$ for $1 \leqslant l<n$ and $y_{n}^{(\mu)}(x)=x_{n}-b_{\mu \rho}(x)$ in the formula (2.6). For $x \in \mathrm{D}_{+}$and any indicial set $i$, we have, following (11.2d) and (2.6),

$$
\begin{align*}
& \mathrm{D}_{i} \tilde{u}(x)=\sum_{\mu=0}^{\infty} a_{\mu}\left[\Sigma \frac{1}{|t|!}\left\{\prod_{m=1}^{|t|} \mathrm{D}_{s}(m) y_{t_{m}(\mu)}^{(\mu)}\right\}\right.  \tag{11.4}\\
&\left.\left(\mathrm{D}_{t} u\right)\left(y_{1}^{(\mu)}(x), \ldots, y_{n}^{(\mu)}(x)\right)\right] .
\end{align*}
$$

where the summation in square brackets is taken over all indicial sets $t$ with $1 \leqslant|t| \leqslant|i|, 1 \leqslant t_{m} \leqslant n$ and all indicial sets $s^{(m)}, m=1, \ldots,|t|$, satisfying $\bigcup_{m=1}^{|t|} s^{(m)}=i$ and $\left|s^{(m)}\right| \geqslant 1$.

For any choice of $s^{(m)}$ and $t$ satisfying the above conditions we will denote by $\tilde{r}, \hat{r}$, and $\bar{r}$, the three disjoint subsequences of the sequence $(1,2, \ldots,|t|)$ defined as follows
$\tilde{r}=\left(\tilde{r}_{1}, \ldots, \tilde{r}_{|\tilde{r}|}\right)$ is formed by all integers $m, 1 \leqslant m \leqslant|t|$, satisfying $t_{m}=n$ and $s^{(m)} \neq(n)$,
$\hat{r}=\left(\hat{r}_{1}, \ldots, \hat{r}_{\mid \hat{r}} \mid\right)$ is formed by all integers $m, 1 \leqslant m \leqslant|t|$, satisfying $t_{m}=n$ and $s^{(m)}=(n)$,
$\bar{r}=\left(\bar{r}_{1}, \ldots, \bar{r}_{|r|} \mid\right)$ is formed by all integers $m, 1 \leqslant m \leqslant|t|$, satisfying $t_{m} \neq n$ and $s^{(m)}=\left(t_{m}\right)$.

We note that if there exists an integer

$$
l \in(1,2, \ldots,|t|)-(\tilde{r} \cup \hat{r} \cup \bar{r})
$$

then $\mathrm{D}_{s(1)} y_{t_{l}}^{(\mu)}=0$. Hence the only non-vanishing terms in the round brackets in (11.4) can be written

$$
\begin{aligned}
\prod_{m=1}^{|t|} D_{s^{(m)}} y_{t_{m}^{(\mu)}}^{(\mu)}=\prod_{m \in \hat{r}} \prod_{m \in \hat{r}} & =\left(-b_{\mu}|\tilde{r}|\right. \\
& =\prod_{r \in \tilde{r}}\left(-b_{\mu}\right)^{\prime r r} \prod_{m \in r} D_{s^{(m)} \rho} \rho(x) \prod_{m \in \hat{r}}\left(1-b_{\mu} \mathrm{D}_{\left.s^{(m)}\right)} \rho(x)\right)
\end{aligned}
$$

where the summation is over all increasing sequences of integers satisfying $\tilde{r} \subset r \subset \tilde{r} \cup \hat{r}$. (Note that $r$ may be empty if $\tilde{r}$ is empty.)

It follows that the whole sum in the square brackets of (11.4) can be written now in the form

$$
\begin{equation*}
\sum_{r} \frac{1}{k!}\left(-b_{\mu}\right)^{|r|} \prod_{m \in r} \mathrm{D}_{s(m)} \rho(x)\left(\mathrm{D}_{t} u\right)\left(y_{1}^{(\mu)}(x), \ldots, y_{n}^{(\mu)}(x)\right) \tag{11.5}
\end{equation*}
$$

where the summation is extended over all decompositions

$$
\begin{equation*}
i=\bigcup_{m=1}^{k} s^{(m)}, \quad 1 \leqslant k \leqslant|i|, \quad\left|s^{(m)}\right| \geqslant 1 \tag{11.5a}
\end{equation*}
$$

and all sequences $r$ satisfying

$$
(11.5 b) \quad r \subset(1,2, \ldots, k), \quad\left|s^{(m)}\right|=1 \quad \text { for } \quad m \notin r
$$

the indicial set $t$ being determined by
(11.5c) $|t|=k, \quad\left(t_{m}\right)=s^{(m)}$ for $m \notin r, t_{m}=n$ for $m \in r$.

We shall separate in (11.5) the terms with $|r|=0$. For such terms $\left|s^{(m)}\right|=1$ for $m=1,2, \ldots, k$; hence, by (11.5a) and (11.5c), $k=|i|$ and the indicial set $t$ is a permutation of the indicial set $i$. Since distinct permutations of the $|i|$ ele-
ments of $i$ give rise by our conventions (see § 2) to distinct decompositions $i=\bigcup_{m=1}^{|i|} s^{(m)}$, we have exactly $|i|$ ! terms with $|r|=0$ each equal to $(|i|!)^{-1}\left(\mathrm{D}_{i} u\right)\left(y_{1}^{(\mu)}, \ldots, y_{n}^{(\mu)}\right)$. Therefore the formula (11.4) can now be written

$$
\begin{align*}
\mathrm{D}_{i} \tilde{u}(x)= & \sum_{\mu=0}^{\infty} a_{\mu}\left(\mathrm{D}_{i} u\right)\left\langle y_{1}^{(\mu)}(x), \ldots, y_{n}^{(\mu)}(x)\right)  \tag{11.6}\\
+ & \sum_{\mu=0}^{\infty} a_{\mu} \sum_{\left\{s^{(m)\},|r| \geqslant 1}\right.} \frac{1}{k!}\left(-b_{\mu}\right)^{|r|} \\
& \quad \times\left\{\prod_{m \in r} \mathrm{D}_{s^{(m)} p}(x)\right\}\left(\mathrm{D}_{t} u\right)\left(y_{1}^{(\mu)}(x), \ldots, y_{n}^{(\mu)}(x)\right),
\end{align*}
$$

where the last summation is over all decompositions (11.5a) and all sequences $r$ satisfying (11.5b) with $|r| \geqslant 1$, $t$ being determined by (11.5c). From these conditions follows the relation

$$
\begin{equation*}
|i|=\sum_{m \in r}\left|s^{(m)}\right|+|t|-|r| \tag{11.6a}
\end{equation*}
$$

By Taylor's theorem we may write for $\mu=0,1, \ldots$ and any non-negative integer $q$

$$
\begin{align*}
& \left(\mathrm{D}_{t} u\right)\left(x^{\prime}, x_{n}-b_{\mu} \rho(x)\right)  \tag{11.7}\\
& \quad=\sum_{l=0}^{q-1} \frac{\left(b_{0}-b_{\mu}\right)^{l}}{l!} \rho(x)^{l}\left(\frac{\partial^{l}}{\partial x_{n}^{l}} \mathrm{D}_{t} u\right)\left(x^{\prime}, x_{n}-b_{0} \rho(x)\right) \\
& \quad+\left(b_{0}-b_{\mu}\right)^{q} \rho(x)^{q} \mathrm{R}(x, t, q, \mu)
\end{align*}
$$

where

$$
\begin{aligned}
& \text { (11.7a) } \mathrm{R}(x, t, q, \mu) \\
& =\left\{\frac{1}{(q-1)!} \int_{0}^{1}\left(\frac{\partial^{q}}{\partial x_{n}^{q}} \mathrm{D}_{t} u\right)\left(x^{\prime}, x_{n}-\left(\tau b_{\mu}+(1-\tau) b_{0}\right) \rho(x)\right)\right. \\
& \times(1-\tau)^{q-1} d \tau, \text { for } q \geqslant 1 \\
& \text { ( } \left.\mathrm{D}_{t} u\right)\left(x^{\prime}, x_{n}-b_{\mu \rho} \rho(x)\right) \text { for } q=0 \text {. }
\end{aligned}
$$

In the double sum of (11.6) we change the order of summations and for each choice of $\left\{s^{(m)}\right\}$ and $r$ replace

$$
\left(\mathrm{D}_{t} u\right)\left(y_{1}^{(\mu)}, \ldots, y_{n}^{(\mu)}\right)
$$

by the right-hand side of (11.7) with

$$
q=\sum_{m \in r}\left|s^{(m)}\right|-|r|=|i|-|t| .
$$

Summing then with respect to $\mu$ and using the second formula in (11.1c) we get our final formula for $\mathrm{D}_{i} \tilde{u}(x), x \in \mathrm{D}_{+}$,

$$
\begin{align*}
& \quad \mathrm{D}_{i} \tilde{u}(x)=\sum_{\mu=0}^{\infty} a_{\mu}\left(\mathrm{D}_{i} u\right)\left(x^{\prime}, x_{n}-b_{\mu} \rho(x)\right)+\sum_{\left\{\left(s^{(m)\}},|r| \geqslant 1\right.\right.} \frac{1}{|t|!} \rho(x)^{i|i|+t \mid}  \tag{11.8}\\
& \times \prod_{m \in r} \mathrm{D}_{s^{(m)}} \rho(x) \sum_{\mu=0} a_{\mu}\left(-b_{\mu}\right)^{|r|}\left(b_{0}-b_{\mu}\right)^{|i|-|t|} \mathrm{R}(x, t,|i|-|t|, \mu) .
\end{align*}
$$

From the properties of $\rho(x)$ (see Theorem II, § 8) we deduce, in view of (11.6a)

$$
\begin{equation*}
\rho(x)^{|i|-|t|} \prod_{m \in r}\left|\mathrm{D}_{\left.s^{(m)}\right)} \rho(x)\right| \leqslant \mathrm{CM}^{|i|}, \tag{11.9}
\end{equation*}
$$

where C depends only on $|i|$ and $n$.
Before we pass to the proof of Theorem I' we prove three lemmas.

Lemma 1. - The mapping $\mathrm{T}_{\tau, \mu}: \mathrm{D}_{+} \rightarrow \mathrm{D}$ defined by

$$
\begin{gathered}
\mathrm{T}_{\tau, \mu}\left(x^{\prime}, x_{n}\right)=\left(x^{\prime}, x_{n}-\left(\tau b_{\mu}+(1-\tau) b_{0}\right) \rho(x)\right), \\
0 \leqslant \tau \leqslant 1, \quad \mu=0,1, \ldots,
\end{gathered}
$$

is a homeomorphism of $\mathrm{D}_{+}$onto D and has the following properties:
i) the Jacobian of $\mathrm{T}_{\tau, \mu}^{-1}$ is bounded by 1 ,
ii) for $x, y \in \mathrm{D}_{+}, \quad\left|\mathrm{T}_{\tau, \mu}(x)-\mathrm{T}_{\tau, \mu}(y)\right| \leqslant c b_{\mu} \mathrm{M}|x-y|$, and for $x \in \overline{\mathrm{D}}, y \in \mathrm{D}_{+},\left|x-\mathrm{T}_{\tau, \mu}(y)\right| \leqslant c b_{\mu} \mathrm{M}|x-y|$, where $c$ depends only on $n$.

Proof. - It is clear that $\mathrm{T}_{\tau, \mu}$ is a continuous mapping of $\mathrm{D}_{+}$into D. For fixed $x^{\prime}: 10^{\tau, \mu} \mathrm{T}_{\tau, \mu}$ transforms the half-line $\left[x^{\prime}, x_{n}>f\left(x^{\prime}\right)\right]$ into the half-line $\left[x^{\prime}, x_{n}<f\left(x^{\prime}\right)\right], 2^{0}$ if $x_{n} \searrow f\left(x^{\prime}\right)$ then $x_{n}-\left(\tau b_{\mu}+(1-\tau) b_{0}\right) p(x) \rightarrow f\left(x^{\prime}\right)$, and

30

$$
\frac{\partial}{\partial x_{n}}\left[x_{n}-\left(\tau b_{\mu}+(1-\tau) b_{0}\right) \rho(x)\right]<-1 .
$$

It follows that the first half-line is transformed homeomorphically onto the second and that $\mathrm{T}_{\tau, \mu}$ is a homeomorphism of $\mathrm{D}_{+}$onto D .

Since $\frac{\partial}{\partial x_{n}} \rho(x) \geqslant \frac{1}{2}$ the Jacobian of $T_{\tau, \mu}, J\left(T_{\tau, \mu}\right)$, satisfies $\mathrm{J}\left(\mathrm{T}_{\tau, \mu}\right)=\left|1-\left(\tau b_{\mu}+(1-\tau) b_{0}\right) \frac{\partial}{\partial x_{n}} \rho(x)\right| \geqslant \frac{1}{2} b_{0}-1 \geqslant 1$ which proves i).

By (11.2a) and Theorem II, $\S 8, \frac{\partial}{\partial x_{l}} \rho(x), l=1, \ldots, n$, are majorated by $B_{1}\left(\frac{1}{2}\right)^{-1} M(M$ is the Lipschitz constant of the graph function) where $\mathrm{B}_{1}$ depends only on $n$. From this it follows that $\rho(x)$ is Lipschitzian on $\overline{\mathrm{D}}_{+}$with Lipschitz constant $2 \mathrm{~B}_{1} \mathrm{M}$. Hence for $x, y \in \mathrm{D}_{+}$
$\left|\mathrm{T}_{\tau, \mu}(x)-\mathrm{T}_{\tau, \mu}(y)\right|^{2}$
$=\left|x^{\prime}-y^{\prime}\right|^{2}+\left|\left(x_{n}-y_{n}\right)-\left(\tau b_{\mu}+(1-\tau) b_{0}\right)(\rho(x)-\rho(y))\right|^{2}$
$\leqslant\left|x^{\prime}-y^{\prime}\right|^{2}+2\left|x_{n}-y_{n}\right|^{2}+2\left(2 \mathrm{~B}_{1} \mathrm{M}\right)^{2} b_{\mathrm{p}}^{2}|x-y|^{2}$
from which the first part of ii) follows.
From Theorem II and Remark I of $\S 8$ we have for $y \in \mathrm{D}_{+}$ that $\rho(y) \leqslant\left(1+\mathrm{M}^{2}\right)^{1 / 2} r_{\mathrm{D}}(y)$; hence for $x \in \overline{\mathrm{D}}, y \in \mathrm{D}_{+}$,

$$
\begin{aligned}
\left|x-\mathrm{T}_{\tau, \mu}(y)\right|^{2} & =\left|x^{\prime}-y^{\prime}\right|^{2}+\left|\left(x_{n}-y_{n}\right)+\left(\tau b_{\mu}+(1-\tau) b_{0}\right) \rho(x)\right|^{2} \\
& \leqslant\left|x^{\prime}-y^{\prime}\right|^{2}+2\left|x_{n}-y_{n}\right|^{2}+2 b_{\mu}^{2}\left(1+\mathrm{M}^{2}\right) r_{\mathrm{D}}(y)^{2}
\end{aligned}
$$

which completes the proof of ii).
Lemma 2. - For any indicial set $i=\left(i_{1}, \ldots, i_{i \mid}\right), 1 \leqslant i_{k} \leqslant n$, any $\tau$ with $0 \leqslant \tau \leqslant 1$ and any $\mu=0,1, \ldots$ define in $\tilde{\mathrm{D}}$ the function $\varphi_{i, \tau, \mu}(x)$ as follows: $1^{0} \varphi_{i, \tau, \mu}(x)=\mathrm{D}_{i} u(x)$ for $x \in \mathrm{D}$; $2^{0} \varphi_{i, \tau, \mu}(x)=\mathrm{D}_{i} u\left(x^{\prime}, x_{n}-\left(\tau b_{\mu}+(1-\tau) b_{0}\right) \rho(x)\right) \equiv \mathrm{D}_{i} u\left(\mathrm{~T}_{\tau, \mu}(x)\right)$ for $x \in \mathrm{D}_{+} ; 3^{\circ} \varphi_{i, \tau, \mu}(x)$ so defined in $\mathrm{D} \cup \mathrm{D}_{+}$is extended by
 to every $\check{\mathrm{P}}^{\beta}(\tilde{\mathrm{D}})$ for $0 \leqslant \beta<1$ and we have
 for $x, y \in \mathrm{D}$,
(11.10b) $\left.\left.\quad \mid \varphi_{i, \tau, \mu}\right\rceil_{\beta, \tilde{\mathrm{D}}} \leqslant c\left(b_{\mu} \mathrm{M}\right)^{n / 2+\beta} \mid \mathrm{D}_{i} u\right]_{\beta, \mathrm{D}} \quad$ for $\quad 0 \leqslant \beta<1$, with constant $c$ depending only on $n$.

Proof. - The following facts are immediate consequences of the properties of $\rho(x)$ and of our assumption that $u$ is a
restriction to $D$ of a function in $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right): 1^{0} \varphi_{i, \tau, \mu}$ is in $\mathrm{C}^{\infty}\left(\mathrm{D} \cup \mathrm{D}_{+}\right)$ and vanishes outside of a bounded set, and $\left.2^{\circ}\right) \varphi_{i, \tau, \mu}$ restricted to D or $\mathrm{D}_{+}$has a continuous extension to $\overline{\mathrm{D}}$ or $\overline{\mathrm{D}}_{+}$respectively and these two extensions agree on the graph G . The last fact justifies our definition of $\varphi_{i, \tau, \mu}$ on G. To prove (11.10a), which also gives that $\phi_{i, \tau, \mu} \in \mathrm{C}^{(0,1)}(\tilde{\mathrm{D}})$, we notice that any two points $x, y \in \tilde{\mathrm{D}}$ can be connected by a polygonal line $\mathrm{P}_{x, y} \subset \tilde{\mathrm{D}}$ composed of two segments (one of them parallel to $x_{n}$-axis), such that $\mathrm{P}_{x, y}$ intersects G in at most one point and is of total length $\leqslant 3 \mathrm{M}|x-y|$. Representing then $\varphi_{i, \tau, \mu}(y)-\varphi_{i, \tau, \mu}(x)$ as integral of derivative along $\mathrm{P}_{x, y}$ and using the properties of $\mathrm{T}_{\tau, \mu}$ (see Lemma 1, ii)) we arrive at (11.10a).

Since $\varphi_{i, \tau, \mu} \in \mathrm{C}^{(0,1)}(\tilde{\mathrm{D}}), \varphi_{i, \tau, \mu}$ belongs to $\mathrm{P}_{\text {ioc }}^{\beta}(\tilde{\mathrm{D}})$ for $0 \leqslant \beta \leqslant 1$. To finish the proof it is enough now to show that (11.10b) holds. To this effect, we write for $0 \leqslant \beta<1$

$$
\begin{aligned}
\left|\rho_{i, \tau, \mu}\right\rangle_{\tilde{\rho}, \tilde{\mathrm{D}}}^{2}=[ & \left.\int_{\mathrm{D}}\left|\mathrm{D}_{i} u(x)\right|^{2} d x+\int_{\mathrm{D}_{+}}\left|\left(\mathrm{D}_{i} u\right)\left(\mathrm{T}_{\tau, \mu}(x)\right)\right|^{2} d x\right] \\
& +\frac{1}{\mathrm{C}(n, \beta)}\left[\int_{\mathbf{D}} \int_{\mathbf{D}} \frac{\left|\mathrm{D}_{i} u(x)-\mathrm{D}_{i} u(y)\right|^{2}}{|x-y|^{n+2 \beta}} d x d y\right. \\
& +\int_{\mathbf{D}_{+}} \int_{\mathbf{D}_{+}}^{a} \frac{\left|\left(\mathrm{D}_{i} u\right)\left(\mathrm{T}_{\tau, \mu}(x)\right)-\left(\mathrm{D}_{i} u\right)\left(\mathrm{T}_{\tau, \mu}(y)\right)\right|^{2}}{|x-y|^{n+2 \beta}} d x d y \\
& \left.+2 \int_{\mathbf{D}_{+}} \int_{\mathbf{D}} \frac{\left|\mathrm{D}_{i} u(x)-\left(\mathrm{D}_{i} u\right)\left(\mathrm{T}_{\tau, \mu}(y)\right)\right|^{2}}{|x-y|^{n+2 \beta}} d x d y\right] .
\end{aligned}
$$

We then transform the integrals over $\mathrm{D}_{+}$into integrals over $D$ by using the transformation $T_{\tau, \mu}$. Lemma 1 gives then immediately

$$
\begin{aligned}
& \left|\varphi_{i, \tau, \mu}\right\rangle_{\tilde{\beta}, \tilde{\mathbf{D}}}^{2} \leqslant 2 \int_{\mathbf{D}}\left|\mathrm{D}_{i} u(x)\right|^{2} d x \\
& \quad+\left[1+3\left(c b_{\mu} \mathrm{M}\right)^{n+2 \beta}\right] \frac{1}{\mathrm{C}(n, \beta)} \int_{\mathbf{D}} \int_{\mathbf{D}} \frac{\left|\mathrm{D}_{i} u(x)-\mathrm{D}_{i} u(y)\right|^{2}}{|x-y|^{n+2 \beta}} d x d y,
\end{aligned}
$$

and this gives formula (11.10b).
Lemma 3. - Let $\left\{s^{(m)}\right\}$ and $r$ be indicial sets, and $q$ an integer, $0 \leqslant q \leqslant|i|-1$, satisfying $r \subset(1,2, \ldots,|i|)$ and

$$
\sum_{m \in r}\left|s^{(m)}\right|-|r|=q \quad \text { sith } \quad\left|s^{(m)}\right| \geqslant 1 .
$$

Then for any $\varphi_{i, \tau, \mu}(x)$, as given in Lemma 2, we define

$$
\mathscr{w}_{\left.i, \tau, \mu, \mid s^{(m)}\right\}, r, q}(x) \equiv \varphi^{\varphi}(x)
$$

for $x \in \tilde{D}$ by
$\omega(x)=\left\{\begin{array}{cl}\rho(x)^{q} \prod_{m \in r} \mathrm{D}_{s}(m) \rho(x)\left(\varphi_{i, \tau, \mu}(x)-\varphi_{i, \tau, 0}(x)\right) & \text { for } x \in \mathrm{D}_{+} \\ 0 & \text { for } x \in \tilde{\mathrm{D}}-\mathrm{D}_{+} .\end{array}\right.$
Then $\rightsquigarrow$ belongs to $C^{(0,1)}(\tilde{\mathrm{D}})$ and to every ${ }^{\mathrm{P}}{ }^{\beta}(\tilde{\mathrm{D}}), 0 \leqslant \beta<1$, and
(11.11a) $\quad|\varphi(x)-\varphi(y)| \leqslant c^{\prime} b_{\mu} M^{\mid i+3} \sup _{\substack{j=|=|=+1 \\ z \in D}}\left|D_{j} u(z)\right||x-y|$,

for $0 \leqslant \beta<1$, where $c^{\prime}$ depends only on $|i|$ and $n$.
Proof. - For notational convenience in this proof we let $\tilde{\varphi}(x)=\varphi_{i, \tau, \mu}(x)-\gamma_{i, \tau, 0}(x), x \in \tilde{D}$, and
$\Phi(x)=\rho(x)^{q} \prod_{m \in r} \mathrm{D}_{\left.s^{(m)}\right)} \rho(x), x \in \mathrm{D}_{+}$, and $=0$ for $x \in \tilde{\mathrm{D}}-\mathrm{D}_{+}$.
Thus $\varphi(x)=\Phi(x) \tilde{\boldsymbol{p}}(x)$ for $x \in \tilde{\mathrm{D}}$.
By Theorem II and Remark 1 of §8,
$1^{0}|\Phi(x)| \leqslant c_{0} \mathrm{M}^{|i|}$ and $|\nabla \Phi(x)| \leqslant c_{0} \mathrm{M}^{|i|+1} r_{\mathrm{D}}(x)^{-1}$ for $x \in \mathrm{D}_{+}$ where $c_{0}$ depends only on $|i|$ and $n$.

From (11.10a) it follows that

$$
|\tilde{\rho}(x)| \leqslant 2 c b_{\tilde{\mu}}^{2} \mathrm{M}^{2} \sup _{\substack{|j|=\mid i l+1 \\ z \in \mathbb{D}}}\left|\mathrm{D}_{j} u(z)\right| r_{\mathrm{D}}(x)
$$

and $|\nabla \tilde{\mathcal{\rho}}(x)| \leqslant 2 c b_{\mu} \mathrm{M}^{2} \sup _{\substack{ \\|j| i|l| l+1 \\ z \in \mathcal{D}}}\left|\mathrm{D}_{j} u(z)\right|$ almost everywhere, $c$ being the constant of Lemma 2.

Clearly $\varphi(x)$ is absolutely continuous on $\mathrm{D} \cup \mathrm{D}_{+}$and from the above, continuous on $\tilde{\mathrm{D}}$ since

$$
\left|\nabla_{\mathscr{P}}(x)\right| \leqslant 4 c c_{0} b_{\mu} \mathrm{M}^{i \mid+3} \sup _{\substack{|j|=|i|+1 \\ z \in \mathrm{D}}}\left|\mathrm{D}_{j} u(z)\right|
$$

a.e. on $\tilde{\mathrm{D}}$. Thus $(11.11 a)$ is satisfied and $\boldsymbol{p} \in \mathrm{C}^{(0,1)}(\tilde{\mathrm{D}})$. $\omega \in P_{\text {ioc }}^{\beta}{ }_{\mathrm{D}}(\tilde{\mathrm{D}}), 0 \leqslant \beta<1$, by virtue of the fact that $\varphi \in \mathrm{C}^{(0,1)}(\tilde{\mathrm{D}})$. Thus to complete the proof of the lemma we need only prove
(11.11b). If $\beta=0$ ( $11.11 b$ ) is clear from $1^{\circ}$ and (11.10b). So we suppose $0<\beta<1$.

Let C be the cone defined by

$$
\mathrm{C}=\left[z=\left(z^{\prime}, z_{n}\right): \quad z_{n} \geqslant 0,\left|z^{\prime}\right| \leqslant|z|\left(1+\mathrm{M}^{2}\right)^{-1 / 2}\right] .
$$

Then it is easy to see that for $x=\left(x^{\prime}, x_{n}\right), x \in \mathrm{D}_{+}$and $z \in \mathrm{C}+x$ we have $r_{\mathrm{D}}(z) \geqslant r_{\mathrm{D}}(x)$. From this it follows that if $x$ and $y$ are points in $\mathrm{D}_{+}$there is a polygonal line $\mathrm{P}_{x, y} \subset(\mathrm{C}+x) \cup(\mathrm{C}+y)$ composed of two segments of total lenth $\leqslant \sqrt{\mathrm{M}^{2}+1}|x-y|$ and such that

$$
\operatorname{dist}\left(\mathrm{P}_{x, y}, \mathrm{D}\right) \geqslant \min \left(r_{\mathrm{D}}(x), r_{\mathrm{D}}(y)\right)
$$

Hence by $1^{0}$ we have:
$2^{0}$ If $x, y \in \mathrm{D}_{+}, r_{\mathrm{D}}(x) \leqslant r_{\mathrm{D}}(y)$ then

$$
|\Phi(x)-\Phi(y)| \leqslant 2 c_{0} \mathrm{M}^{|i|+2} r_{\mathbf{D}}(x)^{-1}|x-y| .
$$

If $x_{0} \in \partial \mathrm{D}$ it is easy to see by considering $\mathrm{D} \cap\left(x_{0}-\mathrm{C}\right)$ that there is a $z \in \mathrm{D},\left|z-x_{0}\right|=2 \sqrt{n-1} \lambda \mathrm{M} \quad(\lambda$ is given by (11.2b)) such that $\mathrm{S}(z, \lambda / 2) \in \mathrm{D}$. Hence :
$3^{\circ}$ For any $x \in \mathrm{D}_{+}$and $x_{0} \in \partial \mathrm{D}$ such that $r_{\mathrm{D}}(x)=\left|x-x_{0}\right|$ there is a conoid in D with vertex $x_{0}$, opening $(4 \sqrt{n-1} \mathrm{M})^{-1}$ and radius $\lambda \mathrm{M}$.

By $1^{\circ}$ and $2^{\circ}$ we have for $x \in \mathrm{D}_{+}$,

$$
\begin{align*}
& \int_{\substack{\mathbf{D}_{+} \\
r_{\mathrm{D}}(x)<r_{\mathrm{D}}(y)}} \frac{|\Phi(x)-\Phi(y)|^{2}}{|x-y|^{n+2 \beta}} d y  \tag{11.12}\\
& \leqslant\left[\int_{\substack{\mathbf{D}_{+0}\left|x-y_{1}\right|<r_{\mathrm{D}}(x) \\
r_{\mathrm{r}^{2}}(x) r_{\mathrm{D}}}}+\int_{\substack{\mathbf{D}_{+}+|x-y|>r_{\mathrm{D}}(x) \\
r_{\mathrm{D}}(x)<r_{\mathrm{D}}(y)}} \frac{|\Phi(x)-\Phi(y)|^{2}}{|x-y|^{n+2 \beta}} d y\right] \\
& \leqslant 4 c_{0}^{2} \mathrm{M}^{2|i|}\left[\mathrm{M}^{4} r_{\mathrm{D}}(x)^{-2} \int_{|x-y|<r_{\mathrm{D}}(x)}|x-y|^{2-n-2 \beta} d y\right. \\
& \left.+\int_{|x-y|>r_{\mathrm{D}}(x)}|x-y|^{-n-2 \beta} d y\right] \\
& \leqslant \frac{2 \omega_{n} c_{0}^{2} \mathrm{M}^{2}|i|+4}{\beta(1-\beta)} r_{\mathrm{D}}(x)^{-2 \beta} .
\end{align*}
$$

By $3^{\circ}$, we have that $\tilde{\mathrm{D}}, \mathrm{D}_{+}$, and D satisfy the hypotheses of Lemma 4, § 9 (replacing $\mathrm{D}^{*}, \mathrm{D}_{1}^{*}$, and $\mathrm{D}_{2}^{*}$ respectively) with $x^{*}=(4 \sqrt{n-1} M)^{-1}$ and $r^{*}=\lambda M$. Hence by $1^{10}$, (11.2),
$(9.13 b)$, and (2.7),
(11.12b) $\quad d_{\beta, \tilde{\mathbf{D}}}\left(\not(\varphi)=\frac{1}{\mathrm{C}(n, \beta)}\left[\int_{\mathbf{D}_{+}} \int_{\mathbf{D}} \frac{|\Phi(x) \tilde{\tilde{v}}(x)|^{2}}{|x-y|^{n+2 \beta}} d y d x\right.\right.$

$$
\begin{aligned}
& \left.+2 \int_{r_{\mathrm{D}}(x)<r_{\mathrm{D}}\left(\boldsymbol{y}^{\prime}\right)}^{+} \int_{\mathbf{D}_{+}} \frac{|\Phi(x) \tilde{\varphi}(x)-\Phi(y) \tilde{\varphi}(y)|^{2}}{|x-y|^{n+2 \beta}} d x d y\right] \\
& \leqslant \frac{1}{\mathrm{C}(n, \beta)}\left[c_{0}^{2} \mathrm{M}^{2 i i \mid} \int_{\mathbf{D}_{+}} \int_{\mathbf{D}} \frac{|\tilde{\varphi}(x)|^{2}}{|x-y|^{n+2 \beta}} d y d x\right. \\
& +4 \int_{\mathbf{D}_{+}}|\Phi(y)|^{2} \int_{\mathbf{D}_{+}} \frac{|\tilde{\rho}(x)-\tilde{\varphi}(y)|^{2}}{|x-y|^{n+2 \beta}} d x d y \\
& \left.+4 \int_{\mathbf{D}_{+}}|\tilde{\rho}(x)|^{2} \int_{\mathbf{D}_{+}} \frac{|\Phi(x)-\Phi(y)|^{2}}{|x-y|^{n+2 \xi}} d y d x\right] \\
& \leqslant c_{0}^{2} \mathrm{M}^{2|i|} d_{\beta, \tilde{\mathrm{D}}}(\tilde{\varphi})+4 c_{0}^{2} \mathrm{M}^{2|i|} d_{\beta, \tilde{\mathrm{D}}}(\tilde{\nu}) \\
& +16 n c_{0}^{2} \mathrm{M}^{2|i|+4} \int_{\mathrm{D}_{+}}|\tilde{\rho}(x)|^{2} r_{\mathrm{D}}(x)^{-2 \beta} d x \\
& \leqslant c_{1} \mathrm{M}^{2 i \mid i+n+3} \lambda^{-2 \beta} \mid \tilde{\rho}_{\hat{\beta}}^{2}, \tilde{\mathrm{D}},
\end{aligned}
$$

where $c_{1}$ depends only on $|i|$ and $n$. The proof of $(11.11 b)$ is completed by (11.10b). This completes the proof of Lemma 3.

We shall use the following special convention for indicial sets:
(11.13) If $t=\left(t_{1}, \ldots, t_{|t|}\right)$ is an indicial set then

$$
t+<k>=(t_{1}, \ldots, t_{|t|}, \underbrace{n, \ldots, n) .}_{k \text {-times }}
$$

Proof of Theorem $I^{\prime}$. - Using the functions

$$
\varphi_{i, \tau, \mu} \quad \text { and } \quad \mathscr{F}_{i, \tau, \mu,\left\{s^{(m)}\right\}, r, q}
$$

introduced in Lemmas 2 and 3 we obtain from (11.7a), (11.8), (11.6a), and (11.1c) for $x \in \tilde{\mathrm{D}}$

$$
\text { 14) } \begin{align*}
& \mathrm{D}_{i} \tilde{u}(x)=\sum_{\mu=0}^{\infty} a_{\mu} \rho_{i, 1, \mu}(x)  \tag{11.14}\\
& +\sum_{\begin{array}{l}
|s(m),|r|>1
\end{array}} \sum_{\mu=0}^{\infty} a_{\mu}\left(-b_{\mu}\right)^{|r|}\left(b_{0}-b_{\mu}\right)^{|i|-|t|} \frac{1}{|t|!(|i|-|t|-1)!} \\
& \times \int_{0}^{1} \Phi_{t+\langle | i\left|-|t|>, \tau, \mu,,\left\{s^{\prime}(m), r, r,|i|-|t|\right.\right.}(x)(1-\tau)^{|i|-|t|-1} d \tau
\end{align*}
$$

Here, when $|i|-|t|=0$, the expression

$$
\frac{1}{(|i|-|t|-1)!} \int_{0}^{1} \ldots d \tau
$$

should be replaced by $w_{t, 1, \mu,\left\{s^{(m)}\right\}, r, 0}(x)$. By (11.1c), it is clear for $x \in \mathrm{D}_{+}$that

$$
\begin{aligned}
& \sum_{\mu=0}^{\infty} a_{\mu}\left(-b_{\mu}\right)^{|r|}\left(b_{0}-b_{\mu}\right)^{|i|-|t| i \mid s x_{t+<}}\langle | i|-|t|>, \ldots,|i|-|t| \\
& \quad=\sum_{\mu=0}^{\infty} a_{\mu}\left(-b_{\mu}\right)^{|r|}\left(b_{0}-b_{\mu}\right)^{|i|-|t|} \rho(x)^{|i|-|t|} \\
& \left.\quad \times \prod_{m \in r} D_{s^{(m)} \rho} \rho(x)\left(\frac{\partial^{|i|-|t|}}{\partial x_{n}^{|i|-|t|}} D_{t} u\right)^{\left(x^{\prime}\right.}, x_{n}-\left(\tau b_{\mu}+(1-\tau) b_{0}\right) \rho(x)\right)
\end{aligned}
$$

and so (11.14) is just a repetition of (11.8). Since for $x \in D$ all the $w_{t+\langle | i|-|t|\rangle, \ldots}(x)^{\prime} s$ vanish and $\varphi_{i, 1, \mu}(x)=\mathrm{D}_{i} u(x)$, hence by (11.1c) we have $\mathrm{D}_{i} u(x)$ on the right side of (11.4) as we should.

Using Minkowski's inequality in (11.14) (for sums as well as for integrals) we obtain from (11.1d), (11.10a) and (11.11a)

$$
\begin{aligned}
& (11.15 a) \quad\left|\mathrm{D}_{i} \tilde{u}(x)-\mathrm{D}_{i} \tilde{u}(y)\right| \leqslant|x-y| \sup _{\substack{|j|=|i|+1 \\
z \in D}}\left|\mathrm{D}_{j} u(z)\right| \\
& \times\left\{\left.c \mathrm{M}^{2} \sum_{\mu=0}^{\infty}\left|a_{\mu}\right| b_{\mu}+\sum_{\left\{s^{(m)}\right\},|r| \geqslant 1} \frac{c^{\prime} \mathrm{M}^{|i|+3}}{|t|!(|i|-|t|)!} \sum_{\mu=0}^{\infty}\left|a_{\mu}\right| b_{\mu}^{|r|+1}\left(b_{\mu}-b_{0}\right)^{|i|-1} t \right\rvert\,\right\}
\end{aligned}
$$

for $\quad x, y \in \tilde{\mathrm{D}}$.
From (11.1d), (11.10b), and (11.12b) we have

$$
\begin{align*}
& \mid \mathrm{D}_{i} \tilde{u} 7_{\beta, \tilde{\mathrm{D}}} \leqslant  \tag{11.15b}\\
\leqslant & \mathrm{M}^{n / 2+\beta}\left|\mathrm{D}_{i} u 7_{\beta, \mathrm{D}} \sum_{\mu=0}^{\infty}\right| a_{\mu} \mid b_{\mu}^{n / 2+\beta} \\
+ & \sum_{\left\{s^{(m)}\right\},|r| \geqslant 1} \sum_{\mu=0}^{\infty}\left|a_{\mu}\right| b_{\mu}^{|r|+n / 2+\beta}\left(b_{\mu}-b_{0}\right)^{|i|-|t|} \frac{1}{|t|!(|i|-|t|)!} \\
\leqslant & \left.\times c^{\prime \prime} \lambda-\beta \mathrm{M}^{\beta+|i|+n+3 / 2} \mid \mathrm{D}_{t+\langle | i|-|t|>} u\right\rceil_{\beta, \mathrm{D}} \\
\leqslant & \left.\mathrm{M}^{\beta+i \mid+n+3 / 2} \sum_{|j|=|i|} \mid \mathrm{D}_{j} u\right\rceil_{\beta, \mathrm{D}},
\end{align*}
$$

where $c^{\prime \prime}$ depends only on $|i|$ and $n$.
Formula $(11.15 a)$ shows that $\mathrm{D}_{i} \tilde{u} \in \mathrm{C}^{(0,1)}(\tilde{\mathrm{D}})$. Since this is true for every indicial set $i, \tilde{u} \in \mathrm{C}^{\infty}(\tilde{\mathrm{D}}) .(11.15 b)$ gives inequality b) of Theorem $I^{\prime}$.

Remark 1. - For $\alpha$ an integer (i.e. $\beta=0$ ) it is immediately seen by following the proofs of Lemmas 2 and 3 and of Theorem $I^{\prime}$ that in inequality $b$ ) of Theorem $I^{\prime}$ and the corresponding inequality of Theorem $\mathrm{I}, \lambda^{-\beta} \mathrm{M}^{\alpha+n+3 / 2}$ can by replaced by $\mathrm{M}^{\alpha}$.

Remark 2. - It is immediately checked that if the graph G is a hyperplane, i.e., $f\left(x^{\prime}\right)=c$ a constant, then we can replace $\rho(x)$ by $x_{n}-b_{n}$ and (11.14) becomes

$$
\mathrm{D}_{i} \tilde{u}(x)=\left\{\begin{array}{lll}
\mathrm{D}_{i} u(x) & \text { for } & x \in \tilde{\mathrm{D}}-\mathrm{D}_{+}  \tag{11.14'}\\
\sum a_{\mu}\left(\mathrm{D}_{i} u\right)\left(x^{\prime}, x_{n}-b_{\mu}\left(x_{n}-c\right)\right) & \text { for } & x \in \mathrm{D}_{+},
\end{array}\right.
$$

and it is easy to see that $\left.\left|D_{i} \tilde{u}_{\beta, \tilde{\mathrm{D}}} \leqslant c\right| \mathrm{D}_{i} u\right\rangle_{\beta, \mathrm{D}}$ where $c$ depends only on $n$.

Let D be an SLG-domain with basis B:
$\mathrm{D}=\left[x: a_{k}<x_{k}<b_{k}, k=1,2, \ldots, n-1, a_{n}<x_{n}<a_{n}+f\left(x^{\prime}\right)\right]$
with Lipschitz constant $M(M \geqslant 1)$, then we define:

$$
\begin{equation*}
\lambda_{\mathrm{D}}=\min \left\{1 / \mathrm{M}, b_{1}-a_{1}, \ldots, b_{n-1}-a_{n-1}, \inf _{x^{\prime} \in \mathrm{B}} f\left(x^{\prime}\right)\right\} \tag{11.16}
\end{equation*}
$$

the minimal width of the SLG-domain D.
Theorem II. - Let D be an SLG-domain with minimal width $\lambda_{\mathrm{D}}$. Then $\mathrm{D} \in \mathcal{E}([0, \infty), \Gamma)$ where

$$
\Gamma\left(\mathrm{I}^{\prime}\right) \equiv \Gamma\left(\left[\alpha_{1}, \alpha_{2}\right]\right)=c \lambda_{\mathrm{D}}^{-(n+1)\left(\alpha \alpha^{*}+2\right)-3 / 2}
$$

and $c$ depends only on $\alpha_{2}^{*}$ and $n$.
Proof. - We suppose D is defined as above.
$1^{0}$ Consider the multiplier $\varphi_{n}\left(x_{n}\right)$ in one variable $x_{n}$ (cf. Lemma 1, §1) such that $\varphi_{n}\left(x_{n}\right)=1$ for $x_{n} \leqslant a_{n}+\lambda_{\mathrm{D}} / 4$ and $=0$ for

$$
x_{n} \geqslant a_{n}+3 \lambda_{\mathrm{D}} / 4
$$

For a function $u \in \operatorname{Mr}(\mathrm{D})$ consider the functions $u^{\prime}$ and $u^{\prime \prime}$ defined as follows : i) $u^{\prime}(x)=\varphi_{n}\left(x_{n}\right) u(x)$ for $x \in \mathrm{D}, u^{\prime}(x)=0$ for $x^{\prime} \in \mathrm{B}, x_{n} \geqslant a_{n}+3 \lambda_{\mathrm{D}} / 4$; ii) $u^{\prime \prime}(x)=\left(1-\varphi_{n}\left(x_{n}\right)\right) u(x)$ for $x \in \mathrm{D}, \quad u^{\prime \prime}(x)=0$ for $x^{\prime} \in \mathrm{B}, x_{n} \leqslant a_{n}+\lambda_{\mathrm{D}} / 4$. Clearly, the function $u^{\prime \prime}(x)$ is defined in the domain $\mathrm{B} \times\left[x_{n}<a_{n}+f\left(x^{\prime}\right)\right]$ which, if we shift the origin to the point ( $x^{\prime}=0, x_{n}=a_{n}$ ) becomes a function of the type treated in Theorem I. We can therefore apply the extension mapping of this theorem and obtain a function $\tilde{u}^{\prime \prime}$ defined in $\mathrm{B} \times\left[-\infty<x_{n}<\infty\right]$. The function $u^{\prime}$ is defined in the domain $\mathrm{B} \times\left[x_{n}>a_{n}\right]$. If we shift the origin to $\left[x^{\prime}=0, x_{n}=a_{n}+1\right]$ and invert the
direction of the $x_{n}$-axis this domain becomes a domain of the type treated in Theorem I (with graph function $f\left(x^{\prime}\right)=1$ ) and by applying the extension mapping of this theorem we obtain a function $\tilde{u}^{\prime}$ defined in $\mathrm{B} \times\left[-\infty<x_{n}<\infty\right]$. Hence $\tilde{u}=\tilde{u}^{\prime}+\tilde{u}^{\prime \prime}$ gives a linear extension mapping of $u \in \mathfrak{M r}(\mathrm{D})$ into $\mathfrak{M r}\left(\mathrm{B} \times\left[-\infty<x_{n}<\infty\right]\right)$. By applying Lemma 1, § 1, Prop. 6, § 2, and Theorem I, we obtain immediately for all $\alpha \geqslant 0$,
(11.17) If $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ then $\tilde{u} \in \check{\mathrm{P}}^{\alpha}\left(\mathrm{B} \times\left[-\infty<x_{n}<\infty\right]\right)$
and

$$
|\tilde{u}|_{\alpha, \mathrm{B} \times\left[-\infty<x_{n}<\infty\right]} \leqslant c \lambda_{\mathrm{D}}^{-(2 \alpha+n+5 / 2)}|u|_{\alpha, \mathrm{D}},
$$

with $c$ depending only on $n$ and $\alpha^{*}$.
$2^{\circ}$ If a function $\varphi$ is defined in an $n$-dimensional rectangle $\left[x: a_{k}<x_{k}<b_{k}, k \leqslant n\right]$ and this rectangle is not the whole space $\mathrm{R}^{n}$, then by interchanging the variables and, if necessary, shifting the origin and inverting the direction of the $x_{n}$-axis we can represent the rectangle in a form

$$
\left[x: a_{k}^{\prime}<x_{k}<b_{k}^{\prime}, k \leqslant n\right]
$$

where $a_{n}^{\prime} \leqslant 0<b_{n}^{\prime}=\min \left(1, b_{n}^{\prime}-a_{n}^{\prime}\right)$. If $a_{n}^{\prime}$ is $-\infty$ we apply Remark 2 directly (the graph-function is now $f\left(x^{\prime}\right)=b_{n}$ ); if $a_{n}^{\prime}>-\infty$ we apply the procedure given in the beginning of $1^{\circ}$. In both cases we obtain an extension

$$
\tilde{\varphi} \in \mathscr{M}\left(\left[x: a_{k}^{\prime}<x_{k}^{\prime}<b^{\prime}, k \leqslant n-1\right]\right) .
$$

From Prop. 6, §2, Lemma 1, §1, and Remark 2 we get for any $\alpha \geqslant 0$ :

$$
\begin{align*}
& \text { If } \mathcal{v} \in \check{\mathrm{P}}^{\alpha}\left(\left[x: a_{k}^{\prime}<x_{k}<b_{k}^{\prime}, k \leqslant n\right]\right) \text { then }  \tag{11.18}\\
& \tilde{\mathscr{\rho}} \in \text { P }^{\alpha}\left(\left[x: a_{k}^{\prime}<x_{k}<b_{k}^{\prime}, k \leqslant n-1\right]\right)
\end{align*}
$$

and

$$
|\tilde{\hat{\varphi}}|_{\alpha,\left[x: a_{k}^{\prime}<x x_{k}<b_{k}^{\prime}, k \leqslant n-1\right]} \leqslant c \lambda^{-\left(\alpha^{*}+1\right)}|\varphi|_{\alpha,\left[x: a_{k}<x_{k}<b_{k}, k \leqslant n\right]}
$$

where $\lambda=\min \left(1, b_{n}^{\prime}-a_{n}^{\prime}\right)$ and $c$ depends only on $\alpha^{*}$ and $n$.
$3^{\circ}$ Coming back to the hypotheses of Theorem II, we apply there the procedure of $1^{0}$, then, at most $n-1$ times, the procedure of $2^{0}$ to obtain successively extension-mappings
to larger and larger rectangles and arrive thus at an extension mapping of $9 \pi(D)$ into $\pi\left(\mathrm{R}^{n}\right)$. Formula (11.17) in part $1^{0}$ and formula (11.18) in part $2^{\circ}$ guarantee that the extension constant $\Gamma\left(\mathrm{I}^{\prime}\right)$ has the form stated in the theorem.

We now consider the property of a domain $D$ to be an SLG-domain with minimal width $\geqslant \lambda_{\mathrm{D}}>0$. The strong localization of this property gives the property of being an LG-domain. The LG-constants of an LG-domain D are the looseness. $\delta$ and the rank $p$ of the corresponding covering $\left\{\mathrm{U}_{k}\right\}$ and also the uniform bound of minimal widths of the SLG-domains $U_{k} \cap D$.

By the general localization theorem of $\S 7$ (Theorem II) we obtain the

Corollary 1. - Every LG-domain belongs to the class $\mathcal{E}([0, \infty))$.

Remarks about spaces ${ }^{\text {P }}{ }^{\alpha, p}(\mathrm{D})$. - All the results of this section are valid for $1<p \leqslant \infty$, and all $\alpha, \alpha \geqslant 0$. The proofs for $1<p<\infty$ are essentially the same as those in case $p=2$ presented in the text (with obvious changes dependent on the exponent $p$ ). The difference in proofs for $p=\infty$ is due to the fact that the restrictions to D of functions in $\mathrm{C}_{0}^{\infty}\left(\mathrm{R}^{n}\right)$ are not dense in $\check{\mathrm{P}}^{\alpha, \infty}(\mathrm{D})$. However, the functions in $\check{\mathrm{P}}^{\alpha, \infty}(\mathrm{D})$ are sufficient lyregular to allow all the developments preceding the proof of Theorem $\mathrm{I}^{\prime}$ without having to replace them by more regular functions.

For $p=1$ one can follow the same line of argument as presented in the text for $p=2$. A difficulty arises only in Lemma 3. This lemma is based on Lemma 4, $\S 9$ which in turn relies on Lemma $3, \S 9$. The last lemma is not valid for $p=1$. Without reference to Lemma 4, §9, Lemma 3 of the present section is still valid for $\beta<1$ but with constant which blows up when $\beta \nearrow 1$. Therefore our extension mapping will not have uniform extension constants $\Gamma\left(\left[\alpha_{1}, \alpha_{2}\right]\right)$ for intervals containing an integer. Curiously enough for $\alpha$ an integer, our extension mapping still transforms $\check{\mathrm{P}}^{\alpha, 1}(\mathrm{D})$ into ${ }_{\mathrm{P}}{ }^{\alpha, 1}\left(\mathrm{R}^{n}\right)$ since for an integer $\alpha$ we do not need Lemma 3 to prove Theorem I. We do not know if this seeming inconsistency is due to our line of proof or is in the essence of things.

## 12. Applications.

Associated with every convex domain D there is a unique maximal cone C with vertex at the origin such that if $x \in \mathrm{D}$ then $x+\mathrm{C} \subset \mathrm{D}$ (or if $x \in \overline{\mathrm{D}}$ then $x+\mathrm{C} \in \overline{\mathrm{D}}$ ) and $x+\mathrm{C}$ contains all half lines issued from $x$ which lie in D (or in $\overline{\mathrm{D}}$ ). Such cones are closed and convex. If D is bounded then $\mathrm{C}=(0)$ and conversely. The dimension of this maximal cone will enter in two of the following propositions.

A spherical cone with vertex at the origin is the closed cone generated by the sphere $S(\theta, x),|\theta|=1$ and $x \leqslant 1$. We call $x$ the opening, $\gamma$ the angular opening where $\sin \gamma=x$ and the half line $l=[t \theta: t \geqslant 0]$ the central axis of the cone. If

$$
\mathrm{C}=\mathrm{C}^{\prime} \cap \overline{\mathrm{S}(0, r)}
$$

where $\mathrm{C}^{\prime}$ is a spherical cone with opening $x$ and central axis $l$ then we call C a bounded spherical cone with opening $x$, central axis $l$ and radius $r$.

Theorem I. - If D is a convex domain then $\mathrm{D} \in \mathcal{E}([0, \infty))$ if and only if D is a ( C$)$-domain.

The proof of Theorem I follows from Props. 2) and 4) below. In view of this theorem it will be of interest to give some sufficient criteria for D to be a ( C )-domain ( ${ }^{45}$ ).

1) Let D be a consex domain. Then D is a ( C )-domain if $n \leqslant 2$ or the dimension of the maximal cone C in D is 0 or $n$.

If $\operatorname{dim} \mathrm{C}=0$ (i.e. D is bounded) and $\mathrm{S}(x, r) \subset \mathrm{D} \subset \mathrm{S}(x, r / \mathrm{x})$ then $r$ and $x$ are $(\mathrm{C})$-constants of D . If $\operatorname{dim} \mathrm{C}=n$ and C contains a spherical cone with opening $\times$ then $\times$ and $r$ are the $(\mathrm{C})$-constants of D where $r$ is an arbitrary positive number.

Proof. - The proof is obvious if $n=1$ or $\operatorname{dim} \mathrm{C}=0$, or $\operatorname{dim} \mathrm{C}=n$, so we need only to consider the case when $n=2$ and $\operatorname{dim} \mathrm{C}=1$.

If C is a straight line then $\partial \mathrm{D}$ is formed by two straight lines $l_{1}$ and $l_{2}$ parallel to C . Then clearly $r=1 / 2 \operatorname{dist}\left(l_{1}, l_{2}\right)$ and $x=1$ are (C)-constants of $D$.
$\left.{ }^{45}\right)$ In example $9, \S 13$ we construct a convex domain in $R^{3}$ which is not a (C)-domain.

The remaining case is when C is a half line, i.e.

$$
\mathrm{C}=[t \theta: t \geqslant 0,|\theta|=1] .
$$

Take any point $x_{0} \in \mathrm{D}$ and let $\mathrm{D}_{+}=\left[x:\left(x-x_{0}, \theta\right)>0, x \in \mathrm{D}\right]$ and $\mathrm{D}_{-}=\left[x:\left(x-x_{0}, \theta\right)<0, x \in \mathrm{D}\right]$. Then $\mathrm{D}_{-}$is a bounded convex domain and by the above a (C)-domain. Clearly $\operatorname{dist}\left(\mathrm{C}+x_{0}, \partial \mathrm{D} \cap \overline{\mathrm{D}}_{+}\right)=r_{1}>0$ and the half-strip with axis $\mathrm{C}+x_{0}$ and width $2 r_{1}$ is contained in $\mathrm{D}_{+}$. Hence we see that for $x \in \partial \mathrm{D} \cap \overline{\mathrm{D}}_{+}$there is a bounded spherical cone with angular opening $\pi / 4$, radius $2 r_{1}$, and vertex $x$ contained in $\overline{\mathrm{D}}_{+}$. From this it follows that D is a $(\mathrm{C})$-domain.

The following elementary lemma, which we give without proof, will be used in the proof of Prop. 2).

Lemma 1. - If the radius of the maximal sphere contained in the convex set D is $r$ and $\mathrm{D} \subset \mathrm{S}(0, \mathrm{R})$ then $|\mathrm{D}| \leqslant \mathrm{Cr} \mathrm{R}^{n-1}$ with C dependent only on $n\left({ }^{46}\right)$.
2) If D is a convex domain but not a $(\mathrm{C})$-domain then $n \geqslant 3$ and the dimension of the maximal cone contained in D is $l$ with $1 \leqslant l \leqslant n-1$. Furthermore $\mathrm{D} \& \mathcal{E}(\boldsymbol{\alpha})$ for $\alpha>(n-l) / 2$ if $l>1$ and $>(n-2) / 2$ if $l=1$.

Proof. - That $n \geqslant 3$ and $1 \leqslant l \leqslant n-1$ is implied by Prop. 1). Suppose that $\mathrm{D} \in \mathscr{E}(\alpha)$ for $\alpha$ satisfying our conditions.

Let $x_{k} \in \partial \mathrm{D}$ be such that the maximal sphere contained in $\mathrm{S}\left(x_{k}, 1\right) \cap \mathrm{D}$ has radius less than $1 / k$. Obviously the $x_{k}$ must exist if the ( C )-condition is not satisfied with constants $r=1 / k$ and $x=1 / k$ for $k=2,3, \ldots$ Then, since $\mathrm{S}\left(x_{k}, 1\right) \cap \mathrm{D}$ is convex, we have by Lemma 1 that

$$
\left|\mathrm{S}\left(x_{k}, 1\right) \cap \mathrm{D}\right| \equiv\left|\mathrm{S}(0,1) \cap\left(\mathrm{D}-x_{k}\right)\right| \searrow 0
$$

as $k \nearrow \infty$.
Let $u \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right)$, be $=1$ on $\mathrm{S}(0,1 / 3)$ and $=0$ outside $\mathrm{S}(0,2 / 3)$.
${ }^{(46)}$ For $n>1$ we obtain $C=\frac{n+1}{n-1} \omega_{n-1}$. Probably the best constant C is

$$
\frac{2}{n-1} \omega_{n-1}
$$

Then with $u_{k}(x)=u\left(x-x_{k}\right)$ for $x \in \mathrm{D}, u_{k} \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ and

$$
\left|u_{k}\right|_{\alpha, \mathrm{D}} \leqslant c\left|u_{k}\right|_{\alpha, \mathrm{s}\left(x_{k}, \mathbf{1}\right) \cap \mathrm{D}}=c|u|_{\alpha, \mathrm{s}(0,1) \cap\left(\mathrm{D}-x_{k}\right)}
$$

where $c$ depends only on $n$. From the previous paragraph we see that $\left|u_{k}\right|_{\alpha, \mathrm{D}} \searrow 0$. It follows that if $\tilde{u}_{k} \in \mathrm{P}^{\alpha}\left(\mathrm{R}^{n}\right)$ is the extension of $u_{k},\left\|\tilde{u}_{k}\right\|_{\alpha} \rightarrow 0$.

Let C be the maximal cone associated with D and suppose $\operatorname{dim} \mathrm{C}=l$ with $2 \leqslant l \leqslant n-1$. Clearly

$$
\left[(\mathrm{C} \cap \mathrm{~S}(0,1))+x_{k}\right] \subset \overline{\mathrm{D}}
$$

for every $k$. Put $G=$ interior of $\mathrm{C} \cap \mathrm{S}(0,1)$ in the $l$-dimensional hyperplane containing it. Then $\mathrm{G}+x_{k} \subset \mathrm{D}$. Let $u_{k}^{\prime}$ be the restriction of $u_{k}$ to $\mathrm{G}+x_{k}$ and $u^{\prime}(x)$ the restriction of $u$ to G. Since $u$ is 1 on $\mathrm{S}(0,1 / 3)$, we have by Prop. 6), § 1

$$
0<\left\|u^{\prime}\right\|_{\alpha-\frac{n-l}{2}, \mathrm{G}}=\left\|u_{k}^{\prime}\right\|_{\alpha-\frac{n-l}{2}, G+x_{k}} \leqslant \frac{\Gamma\left(\alpha-\frac{n-l}{2}\right)}{2^{n-l} \pi^{\frac{n-l}{2}} \Gamma(\alpha)}\left\|\tilde{u}_{k}\right\|_{\alpha} \rightarrow 0
$$

a contradiction.
If $\operatorname{dim} \mathrm{C}=1$ then we fix some $x_{0} \in \mathrm{D}$ and note that for $k$ sufficiently large, say $k \geqslant k_{0}$, the orthogonal projection of $x_{k}$ on the line containing $x_{0}+\mathrm{C}$ lies in $x_{0}+\mathrm{C}$. Furthermore, if $r_{0}=\inf \left\{1 / 3, r_{x_{0}+\mathrm{c}}\left(x_{k}\right)\left(k \geqslant k_{0}\right)\right\}$ then $r_{0}>0$ and the intersection of $\mathrm{D}, \mathrm{S}\left(x_{k}, r_{0}\right)$ and the plane containing $x_{k}$ and $x_{0}+\mathrm{C}$ contains a two-dimensional bounded spherical cone $\Gamma_{k}$ with angular opening $\pi / 4$, radius $r_{0}$ and vertex $x_{k}$. Let $\mathrm{F}_{k}$ be the interior of $\Gamma_{k}$ in the plane which contains it.

We construct $u, u_{k}$ and $\tilde{u}_{k}$ as in the beginning of the proof, denote by $u_{k}^{\prime}$ the restriction of $u_{k}$ to $\mathrm{F}_{k}$, and assume $\alpha>(n-2) / 2$. Then since $u$ is 1 on $S(0,1 / 3)$ there is a $\tau>0$ such that for $k \geqslant k_{0}$ (we use again Prop. 6), §1)
$0<\tau \leqslant\left\|u_{k}^{\prime}\right\|_{\alpha-\frac{n-2}{2}, \mathrm{~F}_{k}} \leqslant \frac{\Gamma\left(\alpha-\frac{n-2}{2}\right)}{2^{n-2} \pi^{\frac{n-2}{2}} \Gamma(\alpha)}\left\|\tilde{u}_{k}\right\|_{\alpha} \rightarrow 0$ a contradic-
3) If D is a convex domain and $\mathrm{S}(0, r) \subset \mathrm{D} \subset \mathrm{S}(0, \mathrm{R})$ then $\mathrm{D} \in \mathcal{E}([0, \infty), \Gamma)$ where $\Gamma\left(\left[\alpha_{1}, \alpha_{2}\right]\right)$ depends only on $n, \alpha_{2}^{*}, r$, and R .

Proof. - Consider the $n$-dimensional rectangle
$\mathrm{B}^{(n)}=\left[x:\left|x_{k}\right|<r / 4 \sqrt{n} \quad\right.$ for $\left.\quad k \leqslant n-1, r / 2<x_{n}<\infty\right]$.
By rotating $\mathrm{B}^{(n)}$ around the origin we cover the whole closed shell $[r \leqslant|x| \leqslant \mathrm{R}]$. We can therefore find a finite number of such rotated rectangles - $\mathrm{B}_{1}^{(n)}, \ldots, \mathrm{B}_{\mathrm{N}}^{(n)}$ - which cover this shell. The same rotations performed on the rectangle

$$
\tilde{\mathbf{B}}^{(n)}=\left[x:\left|x_{k}\right|<r / 2 \sqrt{n} \text { for } k \leqslant n-1, r / 4<x_{n}<\infty\right]
$$

give rectangles $\tilde{\mathrm{B}}_{1}^{(n)}, \ldots, \tilde{\mathrm{B}}_{\mathrm{N}}^{(n)}$ covering the shell with loosenessconstant $\geqslant r / 4 \sqrt{n}$. Since N can be chosen depending only on $n$ and $\mathrm{R} / r$, the rank $p$ of the covering $\left\{\tilde{\mathrm{B}}_{i}^{(n)}\right\}$ depends also only on $n$ and $\mathrm{R} / r \quad{ }^{\left({ }^{47}\right)}$. $\left\{\tilde{\mathrm{B}}_{l}^{(n)}\right\}$ is clearly a covering of $\partial \mathrm{D}$, $r / 4 \sqrt{n}-$ loose and of rank $p$. The intersection $\tilde{\mathrm{B}}_{l}^{(n)} \cap \mathrm{D}$ is obviously a convex SLG-domain which by rotation becomes a domain
$\left[x:\left|x_{k}\right|<r / 2 \sqrt{n}\right.$ for $\left.k \leqslant n-1, r / 4<x_{n}<r / 4+f_{l}\left(x^{\prime}\right)\right]$
with $r / 2<f_{l}\left(x^{\prime}\right)<R$. It follows that the Lipschitz constant of the convex function $f_{l}\left(x^{\prime}\right)$ is $<2 \mathrm{R} / r$. The minimal width of the SLG-domain $\tilde{\mathrm{B}}_{l}^{(n)} \cap \mathrm{D}$ is $=\min (r / 2 \sqrt{n}, r / 2 \mathrm{R})$. Our proposition follows now from Theorem II, § 11 and the localization theorem of $\$ 7$ (Theorem II).
4) If D is a convex $(\mathrm{C})$-domain with ( C )-constants $\%$ and $r$ then $\mathrm{D} \in \mathcal{E}([0, \infty), \Gamma]$ where $\Gamma\left(\left[\alpha_{1}, \alpha_{2}\right]\right)$ depends only on $\alpha_{2}^{*}, n, \kappa$, and $r$.

Proof. - Let $\left\{x_{i}^{\prime}\right\}$ be a maximal set of points in $\mathrm{R}^{n}$ such that $\left|x_{l}^{\prime}-x_{k}^{\prime}\right| \geqslant r$ for $k \neq l$. Then $\left\{\mathrm{S}\left(x_{l}^{\prime}, r / 2\right)\right\}$ are mutually disjoint and $\left\{\mathrm{S}\left(x_{l}^{\prime}, r\right)\right\}$ is a covering of $\mathrm{R}^{n}$. Consider the subset $\left\{x_{k}\right\}$ of $\left\{x_{i}^{\prime}\right\}$ such that $r_{\mathrm{dD}}\left(x_{k}\right)<r$. Then $\left\{\mathrm{S}\left(x_{k}, r\right)\right\}$ is a covering of $\partial \mathrm{D}$ and $\left\{\mathrm{S}\left(x_{k}, 3 r\right)\right\}$ form a $2 r$-loose covering of $\partial \mathrm{D}$.

Next we prove that $\left\{\mathrm{S}\left(x_{k}, 3 r\right)\right\}$ is of rank less than $13^{n}$. If $\mathrm{S}\left(x_{k}, 3 r\right) \cap \mathrm{S}\left(x_{l}, 3 r\right) \neq 0$ then $\left|x_{k}-x_{l}\right|<6 r$ and $\mathrm{S}\left(x_{l}\right.$, $r / 2) \subset \mathrm{S}\left(x_{k}, 13 r / 2\right)$. Since the $\left\{\mathrm{S}\left(x_{l}, r / 2\right)\right\}$ are mutually disjoint,

[^7]$\mathrm{S}\left(x_{l}, r / 2\right) \subset \mathrm{S}\left(x_{k}, 13 r / 2\right)$ for at most $\frac{\omega_{n}}{n}(13 r / 2)^{n} / \frac{\omega_{n}}{n}(r / 2)^{n}=13^{n} x_{l}, s$ which completes this part of the proof.

Let $z_{k} \in \mathrm{~S}\left(x_{k}, r\right) \cap \partial \mathrm{D}$. Since D is a (C)-domain there is a $y_{k}$ such that $\left|z_{k}-y_{k}\right|=r$ and $\mathrm{S}\left(y_{k}, x r\right) \subset \mathrm{D}$. Thus

$$
\mathrm{S}\left(y_{k}, x r\right) \subset \mathrm{D} \cap \mathrm{~S}\left(x_{k}, 3 r\right) \subset \mathrm{S}\left(y_{k}, 5 r\right) .
$$

The proof of the proposition is completed by applying Prop. 3) and Theorem II, § 7 to the covering $\left\{\mathrm{S}\left(x_{k}, 3 r\right)\right\}$ of $\partial \mathrm{D}$.

The next proposition gives some useful sufficient conditions for determining if the union of two adjacent non-tangential convex domains belongs to $\varepsilon([0, \infty))$.
5) Let $\mathrm{D}_{1}$ and $\mathrm{D}_{2}$ be adjacent, bounded, convex domains with slope $\omega\left(\overline{\mathrm{D}}_{1}, \overline{\mathrm{D}}_{2}\right) \geqslant \omega_{0}>0$. Suppose that for some $r>0$ and $火, 0<x \leqslant 1$, there exist points $x_{0} \in \overline{\mathrm{D}}_{1} \cap \overline{\mathrm{D}}_{2}$ and $x_{\mathrm{i}} \in \mathrm{D}_{i}$ such that $\mathrm{S}\left(x_{i}, r\right) \subset \mathrm{D}_{i} \subset \mathrm{~S}\left(x_{i}, r / \mathrm{x}\right)$ and $\mathrm{S}\left(x_{0}, r\right) \subset \overline{\mathrm{D}}_{1} \cup \overline{\mathrm{D}}_{2}$. Then $\mathrm{D}=\left(\overline{\mathrm{D}}_{1} \cup \overline{\mathrm{D}}_{2}\right)^{\circ} \in \mathcal{E}([0, \infty), \Gamma)$, where $\Gamma\left(\left[\alpha_{1}, \alpha_{2}\right]\right)$ depends only on $n, \alpha_{2}^{*}, \omega_{0}, r$, and $x$.

Proof. - Let $\bar{G}$ be the closed convex hull of

$$
\overline{\mathrm{S}\left(x_{0}, r\right)} \cup\left(\mathrm{D}_{1} \cap \mathrm{D}_{2}\right) \quad \text { and } \quad \mathrm{G}=(\overline{\mathrm{G}})^{\circ} .
$$

We shall show that $\overline{\mathrm{G}} \cap \overline{\mathrm{D}}_{1}$ and $\overline{\mathrm{G}} \cap \overline{\mathrm{D}}_{2}$ are $q$-cells with (C)constants bounded from below by $x r / 2$ and $\kappa^{2} / 4$. Since $G$ is convex and $\overline{\mathrm{D}}_{1}$ and $\overline{\mathrm{D}}_{2}$ are $q$-cells with (C)-constants $r$ and $x$ (cf. Prop. 1)) the proof of the proposition will be completed by Prop. 3) and Theorem IV, $b), \S 10$. Since $G \cap D_{1}$ and $G \cap D_{2}$ are bounded convex domains $\overline{\mathrm{G}} \cap \overline{\mathrm{D}}_{1}$ and $\overline{\mathrm{G}} \cap \overline{\mathrm{D}}_{2}$ are $q$-cells and we need only determine their ( C )-constants.

Consider $\overline{\mathrm{G}} \cap \overline{\mathrm{D}}_{i}$. Set $y_{i}=x_{0}+\frac{r}{1+x} \frac{x_{i}-x_{0}}{\left|x_{i}-x_{0}\right|}$. The sphere $\mathrm{S}\left(y_{i}, \frac{r \chi}{1+\chi}\right)$ is contained obviously in $\mathrm{S}\left(x_{0}, r\right)$ and in $\mathrm{D}_{i}$, hence $\mathrm{S}\left(y_{i}, \frac{r x}{1+x}\right) \subset \overline{\mathrm{G}} \cap \overline{\mathrm{D}}_{i}$. On the other hand

$$
\mathrm{S}\left(y_{i}, \frac{2 \boldsymbol{r}}{x}\right) \supset \mathrm{S}\left(x_{0}, r\right) \cup \mathrm{D}_{i}
$$

and therefore $\mathrm{S}\left(y_{i}, \frac{2 r}{k}\right) \supset \overline{\mathrm{G}} \cap \overline{\mathrm{D}}_{i}$. By Prop. 1) it follows that the (C)-constants of $\overline{\mathrm{G}} \cap \overline{\mathrm{D}}_{i}$ are $>\frac{r x}{1+\chi} \geqslant \frac{r x}{2}$ and $>\frac{r \times x}{(1+x) 2 r}>\frac{x^{2}}{4}$ respectively which finishes the proof.

The next proposition gives conditions for D to be in $\mathcal{\varepsilon}([0, \infty))$ when $\mathrm{D}=\left(\bigcup_{k} \mathrm{Q}_{k}\right)^{\circ}$ and the $\mathrm{Q}_{k}$ 's are convex $q$-cells.
6) Let $\left\{\mathrm{Q}_{k}\right\}$ be a system of convex $q$-cells and $\mathrm{D}=\left(\bigcup_{k} \mathrm{Q}_{k}\right)^{0}$. Then $\mathrm{D} \in \mathcal{E}([0, \infty))$ if $1^{0}\left\{\mathrm{Q}_{k}\right\}$ is $\delta$-loose; $2^{\circ}$ there are $r>0$, R , and $x_{k} \in \mathrm{Q}_{k}$ such that $\mathrm{S}\left(x_{k}, r\right) \subset \mathrm{Q}_{k} \subset \mathrm{~S}\left(x_{k}, \mathrm{R}\right) ; 3^{0}$ for every pair of adjacent $q$-cells, $\mathrm{Q}_{k}$ and $\mathrm{Q}_{t}$, there is an $x_{k, l} \in \mathrm{Q}_{k} \cap \mathrm{Q}_{t}$ such that $\mathrm{S}\left(x_{k, l}, r\right) \subset \mathrm{Q}_{k} \cup \mathrm{Q}_{l}\left(r\right.$ is the same as in $\left.2^{0}\right) ; 4^{0}\left\{\mathrm{Q}_{k}\right\}$ is of finite rank (this can be deduced from $2^{\circ}$ if the $\mathrm{S}\left(x_{k}, r\right)$ are disjoint), $5^{0}$ there is an $\omega_{0}>0$ such that $\omega_{0} \leqslant \omega\left(\mathrm{Q}_{k}, \mathrm{Q}_{\imath}\right)$ for $\mathrm{Q}_{k} \cap \mathrm{Q}_{l} \neq 0$ and $6^{\circ} \partial \mathrm{D}$ is an $(n-1)$-manifold or, more generally, $\mathrm{\partial D}_{\mathrm{D}}$ does not cut locally D .

Proof. - $1^{0}, 2^{0}, 4^{0}, 5^{0}$ and $6^{0}$ guarantee that $\left\{\mathrm{Q}_{k}\right\}$ is a regular system. $2^{\circ}, 3^{\circ}$, and $5^{\circ}$ imply, by Props. 3) and 5) that $\mathrm{Q}_{k}^{\circ}$ and $\left(\mathrm{Q}_{k} \cup \mathrm{Q}_{l}\right)^{\circ}$ for $\mathrm{Q}_{k}$ and $\mathrm{Q}_{l}$ adjacent, are in $\mathscr{E}([0, \infty), \Gamma), \Gamma$ independent of $k$ and $l$. The proof is completed by Theorem III, § 10.
7) If $\overline{\mathrm{D}}$ is a finite geometric polyhedron and $\partial \mathrm{D}$ is an ( $n-1$ )-manifold (or does not cut D locally), then $\mathrm{D} \in \mathcal{E}([0, \infty)$ ).

Proof. - Since $\overline{\mathrm{D}}$ is a finite geometric polyhedron it can be decomposed into $\overline{\mathrm{D}}=\bigcup_{k=1}^{\mathrm{N}} \mathrm{Q}_{k}$ where the $\mathrm{Q}_{k}$ 's are convex polyhedra (not necessarily bounded) having at most ( $n-1$ )dimensional intersections. Elementary geometric considerations show that $1^{0}$ the slope between any two polyhedra is positive, $2^{\circ}$ for any two convex polyhedra $\mathrm{Q}_{k}$ and $\mathrm{Q}_{l}$ with $\mathrm{Q}_{k} \cap \mathrm{Q}_{l}(n-1)$-dimensional, there exists an $n$-dimensional convex polyhedron $\bar{G}$ such that $\mathrm{Q}_{k} \cap \mathrm{Q}_{i} \subset \mathrm{G} \subset \mathrm{Q}_{k} \cup \mathrm{Q}_{l}$. Our proposition then follows from Theorem III, Corollary 1b) of $\S 10$ and Prop. 4) of the present section.

## 13. Examples.

In this chapter we are interested primarily in the classes ${ }^{\mathrm{P}^{\alpha}}(\mathrm{D})$ and $\mathrm{P}^{\alpha}(\mathrm{D})$. The following examples are designed to illustrate some of the basic differences between them.

We will only indicate the types of construction involved in each example and will leave the calculations to the reader.

## Example 1.

We show that the inequalities (2.4) of Proposition 3), §2 are the best possible in the following sense: If there are four constants $M_{1}, M_{2}, M_{3}$ and $M_{4}$ such that the inequalities

$$
\begin{aligned}
& \left.\mathrm{M}_{1} \mid u\right]_{\alpha, \mathbf{D}} \leqq|u|_{\alpha, \mathbf{D}} \leqq \mathrm{M}_{2} \mid u 7_{\alpha, \mathbf{D}} \\
& \mathrm{M}_{3}|u|_{m, \mathrm{D}}^{2} \leqq\left.\left|u \tau_{\alpha, \mathrm{D}}^{2}-|u|_{\alpha, \mathrm{D}}^{2} \leqq \mathrm{M}_{4}\right| u\right|_{m, \mathbf{D}} ^{2}
\end{aligned}
$$

hold for all $\alpha \geqq 0$, for all open sets $\mathrm{D} \subset \mathrm{R}^{n}$ and for all functions $u \in \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ (as usual $m=[\alpha]$ ), then

$$
\mathrm{M}_{1} \leqq 2^{-1 / 2}, \quad \mathrm{M}_{2} \geqq 1, \quad \mathrm{M}_{3} \leqq 0, \quad \mathrm{M}_{4} \geqq 1
$$

This statement remains true if we restrict ourselves to $0<\alpha<1$ and $D=R^{n}$. In fact, using Fourier transforms we have, by Proposition 2, § 2

$$
\begin{aligned}
& \mid u\rceil_{\alpha, \mathrm{R}^{n}}^{2}=\int_{\mathrm{R}^{n}}\left(1+|\xi|^{2 \alpha}\right)|\hat{u}(\xi)|^{2} d \xi \\
& |u|_{\alpha, \mathrm{R}^{n}}^{2}=\int_{\mathbf{R}^{n}}^{0}\left(1+|\xi|^{2}\right)^{\alpha}|\hat{u}(\xi)|^{2} d \xi .
\end{aligned}
$$

We notice that.
$1^{0}$ For $\rho \geqq 0,1 \geqq\left(1+\rho^{2}\right)^{\alpha} /\left(1+\rho^{2 \alpha}\right) \geqq 2^{\alpha-1}$ the value 1 being attained at $\rho=0$ and $\rho=\infty$, and the value $2^{\alpha-1}$ being attained at $\rho=1$.
$2^{0}$ For $\rho \geqq 0,1+\rho^{2 \alpha}-\left(1+\rho^{2}\right)^{\alpha}$ is an increasing function of $\rho$ taking the value 0 at $\rho=0$ and 1 at $\rho=\infty$.

It follows therefore that by choosing $\hat{u}(\xi)$ with support arbitrarily near the origin we will show the inequalities for $M_{2}$ and $M_{3}$. By choosing the support of $\hat{u}$ outside of an arbitrarily large sphere one proves the inequality for $\mathrm{M}_{4}$. Finally, by choosing the support of $\hat{u}$ in an arbitrarily small neighborhood of $\partial \mathrm{S}(0,1)$ and taking $\alpha$ arbitrarily small one proves the inequality for $M_{1}$.

Example 2.
We give an example of a domain D such that $\mathrm{P}^{\alpha}(\mathrm{D}) \not \perp \mathrm{P}^{\gamma}(\mathrm{D})$ with $\alpha \leqslant \gamma\left(c f\right.$. Prop. 5, §2) and such that $\overline{\mathrm{P}^{1}(\mathrm{D})} \neq \mathrm{P}^{1}(\mathrm{D})$.

In polar coordinates $\left(x=x_{1}+i x_{2}=\rho e^{i \theta}\right)$ let
$\mathrm{D}=\left[\rho e^{i 0}: 1<\rho<2,0<\theta<2 \pi\right], \quad \mathrm{D}_{+}=\mathrm{D} \cap\left[x_{2}>0\right]$
and $\mathrm{D}_{-}=\mathrm{D} \cap\left[x_{2}<0\right]$. Let $\omega(\theta) \in \mathrm{C}^{\infty}(0,2 \pi)$ and $=1$ for $0<\theta<\pi / 4,=0$ for $\pi / 2<\theta<2 \pi$. Define

$$
u(x) \equiv u\left(\rho \rho^{i \theta}\right)=\omega(\theta)
$$

Obviously $u \in \check{\mathrm{P}}^{m}(\mathrm{D}), m$ an integer. Since $\mathrm{D}_{+}$is a $\mathrm{C}^{x}$ homeomorphic image of a square, $\left.u\right|_{D_{+}}$is in $\check{\mathrm{P}}^{\alpha}\left(\mathrm{D}_{+}\right)$for all $\alpha$. Thus $u \in \breve{P}^{\alpha}(D)$ if and only if

$$
\frac{2}{\mathrm{C}(2, \alpha)} \sum_{k=0}^{m}\binom{m}{k} \sum_{\mid i=k} \int_{\mathrm{D}_{+}} \int_{\mathrm{D}_{-}} \frac{\left|\mathrm{D}_{i} u(x)\right|^{2}}{|x-y|^{n+2 \beta}} d x d y<\infty,
$$

where $m=[\alpha], \beta=\alpha-m$, and this is the case if and only if $0 \leqslant \beta<1 / 2$, i.e. $u \in \check{P}^{\alpha}(\mathrm{D})$ if and only if $\alpha-[\alpha]<1 / 2$. Suppose that $u \in \overline{\mathrm{P}^{1}(\mathrm{D})}$, then there are $u_{n} \in \mathrm{P}^{1}(\mathrm{D})$ such that $\left\|u_{n}-u\right\|_{1, \mathrm{D}} \searrow 0$. Let $\tilde{u}_{n} \in \mathrm{P}^{1}\left(\mathrm{R}^{2}\right)$ be extensions of $u_{n}$, $\check{u}_{n}$ the restriction of $\tilde{u}_{n}$ to $\mathrm{I}=\left[\rho e^{i \theta}: 1<\rho<2, \theta=0\right]$. Then

$$
\left|\tilde{u}_{n}-u\right|_{1, \mathbf{D}_{+} \searrow} \downarrow 0 \quad \text { and } \quad\left|\tilde{u}_{n}\right|_{1, \mathbf{D}_{-}} \searrow 0
$$

Since $\mathrm{D}_{+}$and $\mathrm{D}_{-}$are LG-domains they are in $\mathscr{E}([0, \infty)$ ) (cf. Corollary II, § 11). Hence if we extend $\tilde{u}_{n}-\left.u\right|_{\mathbf{D}_{+}}$and $\tilde{u}_{n}$ to functions in $\mathrm{P}^{1}\left(\mathrm{R}^{2}\right)$ and then restrict the extensions to I , we have by the continuity properties of functions in $\mathrm{P}^{1}\left(\mathrm{R}^{2}\right)$, $\left|\check{u}_{n}-1\right|_{1 / 2, \mathrm{I}} \searrow 0$ and $\left|\check{u}_{n}\right|_{1 / 2, \mathrm{I}} \downarrow 0$, a contradiction.

Another example of a domain $D$ such that ${ }^{\prime} \alpha(D) \nsubseteq{ }^{\prime} \gamma(D)$ with $\alpha \leqslant \gamma$, but with a domain limited by a simple Jordan curve can be constructed as follows. Consider on the $x_{1}$-axis a sequence of points $b_{k}$ with $b_{0}=0$ and such that

$$
b_{2 k+1}-b_{2 k}=b_{2 k+2}-b_{2 k+1}=\frac{1}{k+1} 2^{-2 k} ;
$$

we notice that $b_{i} \nearrow b<3$.
On the segment $\left[b_{i} ; b_{i+1}\right]$ construct an isosceles triangle $\mathrm{T}_{i}$ with altitude $h_{i}$ such that $h_{2 k}=h_{2 k+1}=\frac{1}{k+1}$. Now we
join to $\bigcup_{i} \mathrm{~T}_{i}$ the rectangle $\mathrm{R}=\left[0 \leqslant x_{1} \leqslant 3,-1 \leqslant x_{2} \leqslant 0\right]$ and obtain a domain $D$ with $\bar{D}=\bigcup_{i} T_{i} \cup R$ such that $\partial \mathrm{D}$ is a Jordan curve. Define $u(x)=2^{k} x_{2}$ for $x \in \mathrm{~T}_{2 k+1}$ and $=0$ otherwise. It is immediately checked that $u \in \check{P}^{1}(D)$ and $u \notin \check{\mathrm{P}}^{\alpha}(\mathrm{D})$ for $1 / 2<\alpha<1$. To check the last statement it is enough to estimate the part of $d_{\alpha, \mathrm{D}}(u)$ corresponding to couples $x \in \mathrm{~T}_{2 k}$ and $y \in \mathrm{~T}_{2 k+1} \cap\left[x_{2}>\frac{1}{2} h_{2 k+1}\right]$.

## Example 3.

We give an example of a domain D such that $\tilde{\mathrm{P}}^{\alpha}(\mathrm{D}) \neq \mathrm{P}^{\alpha}(\mathrm{D})$ (cf. Remark 4, § 4).

In $\mathrm{R}^{n}, n \geqslant 2$, let $l=[t \theta: t \geqslant 0]$ for some $\theta,|\theta|=1, \mathrm{D}_{+}$ be the cone with central axis $l$ and opening $1 / 2$ and $D_{-}$the cone with central axis $-l$ and opening $1 / 2$. Then we define $\mathrm{D}=[|x|>2] \cup \mathrm{D}_{+} \cup \mathrm{D}_{-}$. Let $\varphi \in \mathrm{C}^{\infty}\left(\mathrm{R}^{n}\right),=1$ for $|x| \leqslant 1$ and $=0$ for $|x| \geqslant 2$; define $u=\varphi$ if $x \in \mathrm{D}_{+}$and $=0$ for $x \in \mathrm{D}-\mathrm{D}_{+}$. Then $u \in \mathrm{C}^{\infty}(\mathrm{D})$ and $|u|_{\alpha, \mathrm{D}}$ is uniformly bounded on any compact subinterval of $[0, \infty)$; thus $u \in \tilde{\mathrm{P}}^{\alpha}(\mathrm{D})$ for arbitrary $\alpha$. Since $J_{\alpha, \mathbf{D}_{+}, \mathbf{D}_{-}}(u)$ is infinite for $\alpha \geqslant n / 2$, we see that $u \notin \mathrm{P}^{\alpha}(\mathrm{D})$ for $\alpha \geqslant n / 2$.

Example 4.
Our aim here is to obtain an example of

$$
\begin{equation*}
\liminf _{\alpha \not 11} d_{\alpha, \mathbf{0}}(u)=a, \quad \lim _{\alpha \neq 1} \sup d_{\alpha, \mathbf{0}}(u)=b \tag{*}
\end{equation*}
$$

for $0 \leqslant a<b<\infty$ (cf. Prop. 5, § 4).
On the real line $\mathrm{R}^{1}$ consider for $k=1,2, \ldots$ the open intervals

$$
\mathrm{D}_{k}^{\prime}=\left(\frac{1}{2 k}, \frac{1}{2 k}+\frac{1}{20 k^{3}}\right) \quad \mathrm{D}_{k}^{\prime \prime}=\left(\frac{1}{2 k}+\frac{2}{20 k^{3}}, \frac{1}{2 k}+\frac{3}{20 k^{3}}\right) .
$$

Put $\mathrm{D}_{k}=\mathrm{D}_{k}^{\prime} \cup \mathrm{D}_{k}^{\prime \prime} \subset\left(\frac{1}{2 k}, \frac{1}{2 k-1}\right)$ and $\mathrm{D}=\bigcup_{k=1}^{\infty} \mathrm{D}_{k}$. On D we will consider functions $u$ defined as follows. Let $\left\{q_{k}\right\}$ be a sequence of positive numbers bounded by some $q<\infty$. We define

$$
u(x)=q_{k} k^{-2} \quad \text { for } \quad x \in \mathrm{D}_{k}^{\prime}, \quad u(x)=0 \quad \text { for } \quad x \in \mathrm{D}_{k}^{\prime \prime}
$$

Immediate calculations show that for $1 / 2<\alpha<1$ :

$$
\begin{gathered}
d_{\alpha, \mathrm{D}_{k}}(u)=\frac{(20)^{2 \alpha-1}\left(1-3^{1-2 \alpha}\right)}{\alpha(2 \alpha-1) \mathrm{C}(1, \alpha)} \frac{q_{k}^{2}}{k^{7-6 \alpha}} \\
0<d_{\alpha, \mathrm{D}}(u)-\sum_{k=1}^{\infty} d_{\alpha, \mathrm{D}_{k}}(u) \leqslant c(1-\alpha) q^{2}, c \text { an absolute constant. } \\
\text { For } \alpha=1-\frac{1}{\mathrm{~N}}, \mathrm{~N} \text { integer } \geqslant 3
\end{gathered}
$$

$$
\sum_{k=1}^{\mathrm{N}-1} d_{\alpha, \mathrm{D}_{k}}(u)+\sum_{k=\mathrm{N}^{\mathrm{N}}-1}^{\infty} d_{\alpha, \mathrm{D}_{k}}(u) \leqslant c \frac{1}{\mathrm{~N}} \log \mathrm{~N} .
$$

$$
\text { For } q_{k}=q, k=1,2, \ldots, \lim _{\alpha, 1} d_{\alpha, \mathrm{D}}(u)=\lim _{\alpha \not 1} \sum_{k=1}^{\infty} d_{\alpha, \mathrm{D}_{k}(u)}=\frac{20}{9 a} q^{2}
$$

$$
\text { Therefore, if we define } \mathrm{N}_{1}=3, \mathrm{~N}_{i+1}=\mathrm{N}^{\mathrm{N}_{i}}, q_{k}=\sqrt{\frac{9 a}{20}} \text { for } k
$$ lying in the intervals $\mathrm{N}_{2 j-1} \leqslant k<\mathrm{N}_{2}, j=1,2, \ldots$, and $q_{k}=\sqrt{\frac{9 b}{20}}$ for all other $k$ 's, we get $\left(^{*}\right)$ with lim inf and lim sup attained by the sequences

$$
\left\{\alpha_{j}\right\}=\left\{1-\mathrm{N}_{2 j-1}^{-1}\right\} \quad \text { and } \quad\left\{\alpha_{j}\right\}=\left\{1-\mathrm{N}_{2 j}^{-1}\right\}
$$

respectively.
Obviously $\quad d_{1, \mathrm{~s}}(u)=0 \quad$ and $\quad u \in \tilde{\mathrm{P}}^{1}(\mathrm{D})-\mathrm{P}^{1}(\mathrm{D})$, another example where $\tilde{\mathrm{P}}^{1}(\mathrm{D}) \neq \mathrm{P}^{\mathbf{1}}(\mathrm{D})$.

## Example 5.

We construct a simply connected unbounded domain D in the plane $\left(z=x_{1}+i x_{2}=\rho e^{i \theta}\right)$ such that

$$
\liminf _{\alpha \star 0} \delta(\alpha)=a, \quad \limsup _{\alpha \geqslant 0} \delta(\alpha)=b, \quad 0 \leqslant a \leqslant b \leqslant 1
$$

(see (4.7) and Prop. 7), § 4).
The domain is symmetric relative to $x_{1}$-axis. Its part in the upper half-plane is formed by points $z$ satisfying one of three conditions (not mutually exclusive): $10 \quad x_{1}>0$, $0<x_{2}<1 ; 2^{0} 0<\arg (z-i)<\pi a ; 3^{\circ} 0<\arg (z-i)<\pi b$, $\mathrm{N}_{2 j}<|z-i|<\mathrm{N}_{2 j+1}$ for $j=1,2, \ldots$. Here $\mathrm{N}_{i}$ are the integers introduced in the preceding example. The lim inf and $\lim$ sup are attained for $\left\{\alpha_{j}\right\}=\left\{\mathrm{N}_{2 j}^{-1}\right\}$ and $\left\{\mathrm{N}_{2 j+1}^{-1}\right\}$ respectively.

## Example 6.

We construct a polyhedron $\mathrm{P} \subset \mathrm{R}^{3}$ such that $\partial \mathrm{P}$ is an $(n-1)$ manifold but P is not an LG-domain.

Let $\theta_{k}$ be the unit vector in the direction of the positive $x_{k}$-axis. We construct two tetrahedrons $\mathrm{T}_{1}$ and $\mathrm{T}_{2}$ with vertices

$$
\begin{aligned}
& \mathrm{T}_{1}: 0, \theta_{1}, \theta_{1}+\theta_{2}, \theta_{1}-\theta_{2}+\theta_{3}, \\
& \mathrm{~T}_{2}: 0,-\theta_{1},-\theta_{1}-\theta_{2},-\theta_{1}+\theta_{2}+\theta_{3} .
\end{aligned}
$$

If Q is the cube $\left|x_{1}\right|<2,\left|x_{2}\right|<2,0<x_{3}<4$, then

$$
P=Q-\left(T_{1} \cup T_{2}\right)
$$

is the required polyhedron. At the origin its boundary has no local representation as a graph.

The next example shows that the condition - oD does not cut locally D - is weaker than the condition that $\partial \mathrm{D}$ is an ( $n-1$ )-manifold.

Example 7.
We nos construct a polyhedron $\mathrm{P} \subset \mathrm{R}^{3}$ such that $\partial \mathrm{P}$ does not cut locally P but $\mathrm{\partial} \mathrm{P}$ is not a 2-manifold.

In the notation of Example 6 let $T_{1}$ and $T_{2}$ be two pyramids with vertices

$$
\begin{aligned}
& \mathrm{T}_{1}: \theta_{3}, \theta_{1}, \theta_{2},-\theta_{1},-\theta_{2} \\
& \mathrm{~T}_{2}: \theta_{3}, 1 / 2 \theta_{1}, 1 / 2 \theta_{2},-1 / 2 \theta_{1},-1 / 2 \theta_{2} .
\end{aligned}
$$

Then $\mathrm{P}=\mathrm{T}_{1}-\mathrm{T}_{2}^{\mathrm{o}}$ is the desired polyhedron; in particular, $\partial \mathrm{P}$ is not a manifold at $\theta_{3}$.

## Example 8.

We give an example of a bounded convex set D and a $\mathrm{C}\left({ }^{0,1}\right)$ homeomorphism T , such that $\mathrm{T}(\mathrm{D})$ is not an LG-domain.

Consider in polar coordinates in $\mathrm{R}^{2}\left(\rho e^{i \theta}=x_{1}+i x_{2}\right)$ the $\mathrm{C}^{(0,1)}$-homeomorphism T given by

$$
T\left(\rho e^{i \theta}\right)=\rho e^{i(\theta-\log \rho)} .
$$

Then $\mathrm{D}=[0<\rho<1,0<\theta<\pi / 2]$ is convex but $\mathrm{T}(\mathrm{D})$ is not an LG-domain; in particular, $T(D)$ is not locally a graph at the origin.

## Example 9.

We construct an unbounded convex domain $\mathrm{D} \subset \mathrm{R}^{3}$ which contains a 2-dimensional cone but is not a ( C )-domain.
Let $\pi_{1, k}$ and $\pi_{2, k}$ be the couple of hyperplanes which contain the line $l_{k}=\left[\left(x_{1}, x_{2}, x_{3}\right): x_{3}=k x_{1}-3 k^{2}, x_{2}=0\right], k=1,2, \ldots$, and are tangent to the sphere $[|x| \leqslant 1]$. Let further $\pi_{1, k}^{+}$ and $\pi_{2, k}^{+}$be the half spaces determined by $\pi_{1, k}$ and $\pi_{2, k}$ such that $[|x|<1] \subset \pi_{1, k}^{+} \cap \pi_{2, k}^{+}$. Then $\mathrm{D}=\bigcap_{k=1}^{\infty}\left(\pi_{1, k}^{+} \cap \pi_{2, k}^{+}\right)$. It is not difficult to see that $x^{k}=\left(6 k, 0,3 k^{2}\right) \in \partial \mathrm{D} \cap \pi_{1, k} \cap \pi_{2, k}$ and that the largest sphere contained in $\mathrm{S}\left(x^{k}, 1\right) \cap \mathrm{D}$ has a radius less than $\frac{\sqrt{1+k^{2}}}{3 k^{2}} \searrow 0$. Thus $D$ is not a $(\mathrm{C})$-domain. It is also clear that the 2 -dimensional cone $\left[x_{1}<0, x_{2}=0, x_{3}>0\right]$ is contained in D.

## Appendix. Complete continuity of standard norms.

We restrict ourselves to bounded open sets in $\mathrm{R}^{n}$.
For potential norms $\|u\|_{\alpha, \mathrm{D}}$ the question of complete continuity is settled by Prop. 3 ), $\S 1$ : for $\beta<\alpha$, the $\alpha$-norm is c.c. (completely continuous) rel. (relative to) the $\alpha$-norm.

For standard norms the situation is much more complicated. The question of complete continuity for integral orders was investigated quite thoroughly by F. Rellich (see [6]): $1^{0}$ There are bounded domains for which $|u|_{0, \mathrm{D}}$ is not c.c. rel. $|u|_{1, \mathrm{D}} 2^{0}$ If $|u|_{0, \mathrm{D}}$ is c.c. rel. $|u|_{1, \mathrm{D}}$, then for any two integers $0 \leqslant m_{1}<m$, the norm of order $m_{1}$ is c.c. rel. the norm of order $m$. $3^{\circ}$ The complete continuity of the 0 -norm rel. the 1 -norm holds for domains whose boundaries are piecewise graph-manifolds $\left.{ }^{(48}\right)$.

When we turn to norms of non-integral order, the situation changes considerably. For domains of $3^{\circ}$ above, in general the $\alpha$-norm is not c.c. rel. to the 1 -norm for $0<\alpha<1$ (see
$\left.{ }^{48}\right)$ i.e. those which in some coordinate system can be represented as a graph of a continuous function $x_{n}=f\left(x_{1}, \ldots, x_{n-1}\right)$ (but the function is not necessarily Lipschitzian). The boundary is supposed to be covered by a finite number of closed graph-manifolds. Domains with this property form a larger class than the G-domains.

Example 2, §13). However, several general results can be obtained which we describe here.

1) For $\beta \geqslant \alpha,|u|_{\beta, \mathrm{D}}$ is never c.c. rel. $|u|_{\alpha, \mathrm{D}}$.

This is obvious if we consider the norms on the subspace of functions $\mathrm{C}^{\infty}$ vanishing outside of a relatively compact subdomain of $D$.
2) If $|u|_{0, \mathrm{D}}$ is c.c. rel. $|u|_{\alpha, \mathrm{D}}$ with $0<\alpha<1$, then for any $\beta$ with $0<\beta<\alpha,|u|_{\beta, \mathrm{D}}$ is c.c. rel. $|u|_{\alpha, \mathrm{D}}$.

For the proof we decompose, for arbitrarily small $\varepsilon$,

$$
\begin{aligned}
|u|_{\beta, \mathrm{D}}^{2}=|u|_{0, \mathrm{D}}^{2}+\frac{1}{\mathrm{C}(n, \beta)} & {\left[\iint_{|x-y|>\varepsilon}+\iint_{\left|\dot{x}-\left.\right|^{2}\right|<\varepsilon}\right] } \\
\leqslant & \leqslant\left(1+\frac{\varepsilon^{-2}-\omega_{n}}{\beta \mathrm{C}(n, \beta)}\right)|u|_{0, \mathrm{D}}^{2}+\frac{\varepsilon^{2 \alpha} \mathrm{C}(n, \alpha)}{\varepsilon^{2 \beta} \mathrm{C}(n, \beta)}|u|_{\alpha, \mathrm{D}}^{2} .
\end{aligned}
$$

3) If $\mathrm{D} \in \mathscr{E}(\alpha)$ and $\beta<\alpha$, then $|u|_{\ell, \mathrm{D}}$ is c.c. rel. $|u|_{\alpha, \mathrm{D}}$.

Proof. - $\|u\|_{\beta, \mathrm{D}}$ is c.c. rel. $\|u\|_{\alpha, \mathrm{D}}$ by Prop. 3, § 1 and since $\|u\|_{\alpha, \mathrm{D}}$ is equivalent to $|u|_{\alpha, \mathrm{D}}$ and $|u|_{\beta, \mathrm{D}} \leqslant\|u\|_{\beta, \mathrm{D}}$ (Prop. 4, §2) the proposition is clear.
4) If $|u|_{\rho, \mathrm{D}}$ is c.c. rel. $|u|_{\alpha, \mathrm{D}}$ for all $\alpha$ and $\beta$ with $0 \leqslant \beta<\alpha \leqslant 1$, then $|u|_{\beta, \mathrm{D}}$ is c.c. rel. $|u|_{\alpha, \mathrm{D}}$ for any $\beta<\alpha$.

This becomes obvious if one compares each term in the expression of $|u|_{\substack{2 \\, D}}$ with suitable terms in the expression of $|u|_{\alpha, \mathrm{D}}^{2}$.
5) If $|u|_{\beta, \mathrm{D}}$ is c.c. rel. $|u|_{\alpha, \mathrm{D}}$ and if T is a $\mathrm{C}^{\left(\alpha^{*}, 1\right)-h o m e o m o r-~}$ phism of D onto $\mathrm{D}^{*}$, then $|u|_{\beta, \mathrm{D}^{*}}$ is c.c. rel. $|u|_{\alpha, \mathrm{D}^{*}}$.

This is immediate since the correspondence

$$
u(x) \rightarrow u^{*}\left(x^{*}\right)=u\left(\mathbf{T}^{-1} x^{*}\right)
$$

is a linear and topological isomorphism of $\check{\mathrm{P}}^{\beta}(\mathrm{D})$ onto $\check{\mathrm{P}}^{\beta}\left(\mathrm{D}^{*}\right)$ for all $\beta$ with $\beta \leqslant \alpha^{*}+1$ (see Prop. 8), § 2).

Theorem I. - (Localization theorem.). If $\left\{\mathrm{U}_{k}\right\}, k=1$, $2, \ldots, \mathrm{~N}$, is an open covering of $\overline{\mathrm{D}}$ such that $|u|_{\beta, \mathrm{D} \cap \mathrm{v}_{k}}$ is c.c. rel. $|u|_{\alpha, \mathrm{D} \cap \mathrm{v}_{k}}$ then $|u|_{\beta, \mathrm{D}}$ is c.c. rel. $|u|_{\alpha, \mathrm{D}}$.

Proof. - If $\beta$ is an integer our statement follows immediately from the following two inequalities :
(i) $|u\rangle_{\rho, \mathrm{D}}^{2} \leqslant \sum_{k=1}^{\mathrm{Y}}|u\rangle_{\rho, \mathrm{D} \cap \mathrm{U}_{k}}^{2}$,
(ii) $\left.\left.\sum_{k=1}^{\mathrm{N}} \mid u\right\rceil_{\alpha, \mathrm{D} \cap \mathrm{U}_{k}}^{2} \leqslant \mathrm{~N} \mid u\right\rceil_{\alpha, \mathrm{D}}^{2}$.

If $\beta$ is not an integer then we have to consider the looseness $\delta$ of the covering $\mathrm{U}_{k}$ and replace the inequality (i) by :
$\left.\left.\left.|u\rangle_{\beta, \mathrm{D}}^{2} \leqslant \frac{\omega_{n}}{\left(\beta-\beta^{*}\right) \mathrm{C}\left(n, \beta-\beta^{*}\right)} \delta^{-2\left(\beta-\beta^{*}\right)} \sum_{k=1}^{\mathrm{N}} \right\rvert\, u\right\rceil_{\beta^{*}, \mathrm{D} \cap \mathrm{U}_{k}}^{2}+\sum_{k=1}^{\mathrm{N}} \mid u\right\rceil_{\beta, \mathrm{D} \cap \mathrm{U}_{k}}^{2}$.
Remark 1. - For $\beta$ an integer the same proof would give a stronger theorem where $\left\{\mathrm{U}_{k}\right\}$ would not be required to cover the whole of $\overline{\mathrm{D}}$ but only to cover D up to a set of Lebesgue measure 0 .

Theorem II. - If D is L-convex then $|u|_{\beta, \mathrm{D}}$ is c.c. rel. $|u|_{\alpha, \mathrm{D}}$ for all $\beta<\alpha$.

The proof follows immediately from Theorem I and Prop. 5), 4 ), and 3 ), since the covering of a bounded L-convex set can be chosen finite, and bounded convex domains belong to $\mathscr{E}([0, \infty))$.

Remark 2. - The bounded L-convex domains together with those of class $\mathscr{E}(\boldsymbol{\alpha})$ form the most general class of domains we know in which the complete continuity theorem holds for all $\beta>\alpha$.

Remark 3. - The problem of complete continuity for unbounded domains seems unsolved. We were not able to find any examples of an unbounded domain where the complete continuity holds for any $\beta<\alpha$. For very large classes of unbounded domains we can prove that there cannot be complete continuity and it appears that the only doubtful cases are domains of finite measure with very rapidly and regularly decreasing measure when one approaches infinity.

[^0]:    ${ }^{(1)}$ This change of definition was already applied in some published papers and in papers which are to appear soon.

[^1]:    $\left.{ }^{(3}\right)$ This proposition is not true in general if the hypothesis is changed to $u \in \mathrm{~L}_{\mathrm{ioc}}^{p}(\mathrm{D}), v \in \mathrm{~L}_{\mathrm{loc}}^{q}(\mathrm{D})$ with $1<p, q<\infty, 1 / p+1 / q=1$.

[^2]:    $\left.{ }^{(15}\right)$ We remind the reader that $\left(\mathrm{D}_{i} u\right)\left(x^{\prime},-h_{p} x_{n}\right)$ means $\left(\mathrm{D}_{i} u\right)(y)$ evaluated at $y=\left(x^{\prime},-h_{\mu} x_{n}\right)$.

[^3]:    ${ }^{(22)}$ Since $\mathrm{G}_{2_{n+2 \alpha}}(x)$ is a function of $|x|$ alone we write $r$ for $|x|$ to make the notation simpler.

[^4]:    $\left.{ }^{(26}\right) \mathcal{E}(\alpha)$ is the extension class corresponding to the degenerate interval formed by a single point $\alpha$.

[^5]:    ${ }^{(36)}$ Simple examples show that Theorem 1, $\left.b\right)$ is not true when $p=1, \alpha=1$ $n=1, \mathrm{D}_{1}=(0 ; 1), \mathrm{D}_{2}=(-1 ; 0)$.

[^6]:    $\left.{ }^{(38}\right)$ Since $\omega\left(F_{1}, F_{2}\right)=\operatorname{dist}\left(F_{1}, F_{2}\right)$ for $F_{1} \cap F_{2}=0$, we could combine the looseness of the uniform system and $2^{\circ}$ in the single requirement that $\omega\left(\mathrm{Q}_{k}, \mathrm{Q}_{l}\right) \geqslant 4 \delta$ for $k \neq l$.

[^7]:    $\left.{ }^{(47}\right)$ By a more careful construction we could make the rank depend only on $n$.
